Terminal significance

+Vs	Cable-pull encoder supply voltage. (Redundant configuration provides decoupled dual voltage supply (+Vs1/+Vs2) separated by diodes.
0 V	Cable-pull encoder ground connection relating to +Vs.
Iout	Current output. Load: <500 Ω
Uout	Voltage output. Current output: max. 10 mA Load resistor: >1 kΩ between Uout / 0 V
Set	Teach input. Resting state: Low Level High: >0.7 x +Vs Level Low: <0.3 x +Vs Pull-Down resistor: 10 kΩ
DV/Status	Diagnostic output/Teach output. R _L - Vs: High: >(Vs - 1.0 V) Low: <3.0 V R _L - GND: High: >(Vs - 3.0 V) Low: <1.0 V I _{Lmax} = 10 mA Upon any short-time disturbance, DV will go on Low for 1 second.
Drain	Encoder housing.

Teach process

The teaching functionality will be disabled 5 minutes after cable-pull encoder power on. Time begins to start anew after each teaching operation.

1. Set input on HIGH for 6 seconds. DV/ status output reflects the reverted input and will start oscillating after 5 seconds. Now set input on LOW.
2. Get cable-pull encoder in position 1 intended for voltage output 1/current 1.
3. Set input on HIGH for 1 second. DV/ status output will switch to LOW for 3 seconds and then start oscillating.
4. Get cable-pull encoder in position 2 intended for voltage output 2/current 2.
5. Set input on HIGH for 1 second. DV/Status output will switch to HIGH for 3 seconds and then shortly oscillate to signal that the teaching operation has been completed.

In the event of one out of both taught limits being beyond the sensing range or too close to each other, the DV/status output will oscillate shortly. There is no teaching of sensing range. The operation must be repeated under consideration of minimum teaching limit and sensing range.

Set / restore default

Set input on HIGH for 16 seconds. (After 5 seconds, the DV/status output will start oscillating while restoring default in second 15).

Note: The cable pull has to be completely drawn in.
