

Inclination sensor redundant

Redundant design

Linearity: <0.1°

Resolution: 0.01°

Measuring range: 0...90°, 0...180°, 0...360°

Protection type: IP67

Description

Inclination sensors determine the orientation angle of an object concerning the gravitational field of the earth. The application types for these sensors are versatile. At cranes and excavators the inclination sensor measures the angle and extension of the boom along with the load weight and calculates if the machine is working within the manufacturer suggested safety margins.

The sensor is equipped with a measurement range of 0...90°, 0...180° or 0...360° (others on request) and offers an additional higher precision and accuracy over the entire measurement range. The resolution is 0.01° of F.S.

Customer specific implementations are possible as a result of the modular construction system.

Features

- Measurement range 0...90°, 0...180° or 0...360° (others on request)
