## Function and system design

### Measuring principle

Electronic recording, conversion and display of input signals in industrial temperature measurement.

### Measuring system

*Example of an application of the field transmitter*

The iTEMP® HART® temperature field transmitter TMT142 is a two-wire transmitter with an analogue output, an input for resistance thermometers and resistance transmitters in 2-wire, 3-wire or 4-wire connection, thermocouples and voltage transmitters. The LC display shows the current measured value digitally and as a bar graph with an indicator for limit value violation. The TMT142 can be operated via the HART® protocol using a handheld terminal (DXR375) or PC (FieldCare or ReadWin® 2000 operating software).

#### **Corrosion detection**

Sensor connection line corrosion can corrupt the measured value. For this reason, the device gives you the opportunity to detect corrosion for thermocouples and resistance thermometers with a 4-wire connection before measured value corruption takes place.

# Input

**Measured variable** Temperature (temperature linear transmission behaviour), resistance and voltage

**Measuring range** The transmitter records different measuring ranges depending on the sensor connection and input signals (see 'Type of input').
