## Function and system design

**Measuring principle** Electronic measurement and conversion of input signals in industrial temperature measurement.

**Measuring system** The iTEMP<sup>®</sup> HART<sup>®</sup> DIN rail TMT112 temperature transmitter is a 2-wire transmitter with an analog output. It has measurement input for resistance thermometers (RTD) in 2-, 3- or 4-wire connection, thermocouples and voltage transmitters. Setting up of the TMT112 is done using the HART<sup>®</sup> protocol with hand operating module (DXR275, DXR375) or PC (e.g. configuration software ReadWin<sup>®</sup> 2000 or FieldCare).

## Input

**Measured variable** Temperature (temperature linear), resistance and voltage.

**Measuring range** Depending upon the sensor connection and input signal. The transmitter evaluates a number of different measurement ranges.

**Example for calculating measured error for ambient temperature drift:**

Input temperature drift  $\Delta\theta = 10 \text{ K}$  (18 °F), Pt100, measuring range 0 to 100 °C (32 to 212 °F)

Maximum process temperature: 100 °C (212 °F)

Measured resistance value: 138.5  $\Omega$  (IEC 60751) at maximum process temperature

Typical temperature drift in  $\Omega$ : (0.0015% of 138.5  $\Omega$ ) \* 10 = 0.02078  $\Omega$

Conversion to Kelvin: 0.02078  $\Omega$  / 0.385  $\Omega/\text{K}$  = 0.05 K (0.09 °F)

<b>Influence of load</b>	$\leq \pm 0.02\%/100 \Omega$ Values refer to the full scale value
<b>Long term stability</b>	$\leq 0.1\text{K}/\text{year}$ or $\leq 0.05\%/ \text{year}$ Values under reference operating conditions. % refer to the set span. The highest value is valid.
