PRK 55 Ex Retro-reflective photoelectric sensors with polarization filter for bottles

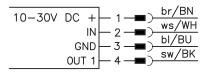

- Polarized retro-reflective photoelectric sensor, autocollimation optics with visible red light
- Particularly suited for highly transparent bottles (PET and glass)
- 316L stainless steel housing in WASH-DOWN-Design
- Scratch resistant and non-diffusive plastic front cover
- Easy adjustment via lockable teach button or teach input
- Certification
 - (Ex) II 3G Ex nA op is IIB T4 Gc X
 - ⟨Ex⟩ II 3D Ex tc IIIC T70°C Dc IP67 X

Dimensioned drawing

Electrical connection

Connector, 4-pin

Connector, 3-pin

DANGER

- Observe the notices for installation and commissioning!
- Do not disconnect the sensor connection within the potentially explosive area while under voltage!

Accessories:

(available separately)

Cables with M8 connector

Attention!

Only use cables with axial (straight) plug outlet (see dimensioned drawing).

PRK 55 ExRetro-reflective photoelectric sensors with polarization filter for bottles

Sensor adjustment (teach) via teach button

 $\prod_{i=1}^{n}$

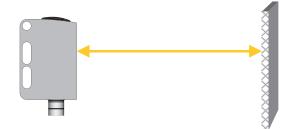

The sensor is factory-adjusted for maximum operating range.

Recommendation: teach only if the desired objects are not reliably detected.

• Prior to teaching:

Clear the light path to the reflector!

The device setting is stored in a fail-safe way. A reconfiguration following voltage interruption or switch-off is thus not required.

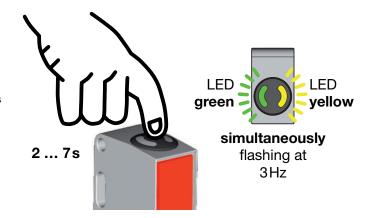

Teach for 11% sensor sensitivity (highly transparent bottles and foils with thickness > 20µm)

- Press teach button until both LEDs flash <u>simultaneously</u>.
- Release teach button.
- Ready.

After the teaching, the sensor switches when about 11 % of the light beam are covered by the object.

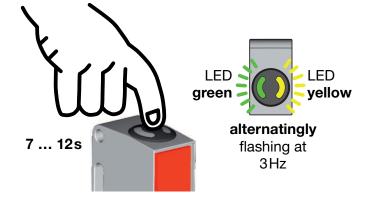

Teach for 18% sensor sensitivity (standard bottles)

- Press teach button until both LEDs flash alternatingly.
- Release teach button.
- Ready.

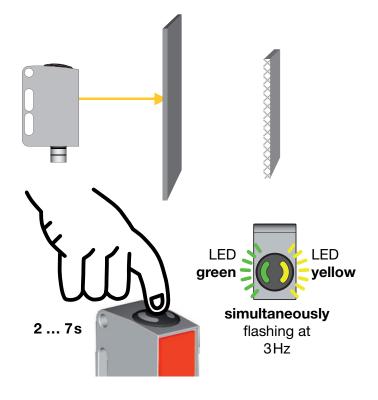

After the teaching, the sensor switches when about 18% of the light beam are covered by the object.

Teaching for maximum operating range (factory setting at delivery)

- Prior to teaching: <u>Cover</u> the light path to the reflector!
- Press teach button until both LEDs flash simultaneously.
- Release teach button.
- Ready.

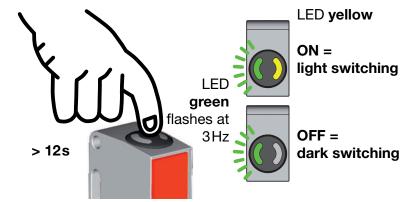

Adjusting the switching behavior of the switching output - light/dark switching

 Press teach button until the green LED flashes.
 The yellow LED displays the current setting of the switching output:

ON = output light switching
OFF = output dark switching

- Continue to press the teach button in order to change the switching behavior.
- Release teach button.
- Ready.

Notices for the safe use of sensors in potentially explosive areas

The valid range encompasses devices of Group II, Category 3, Zones 2 ("Gas Ex") and 22 ("Dust Ex").

- Check whether the equipment classification corresponds to the requirements of the application.
- A safe operation is only possible if the equipment is used properly and for its intended purpose.
- Electrical equipment may endanger humans and (where applicable) animal health, and may threaten the safety of goods if used incorrectly or under unfavorable conditions in potentially explosive areas.
- The applicable national regulations (e.g. EN 60079-14) for the configuration and installation of explosion-proof systems must be observed.

Installation and Commissioning

- The devices must only be installed and commissioned by trained electricians. They must be aware of the regulations and operation of explosion-proof equipment.
- Static charge on plastic surfaces must be avoided.
- To prevent unintentional separation under voltage, devices with connector (e.g. Series 46B) must be equipped with a safeguard or a mechanical interlocking guard (e.g. K-V M12-Ex, part no. 50109217). The warning sign "Do not disconnect under voltage" that is supplied with the device must be attached to the sensor or its mounting bracket so that it is clearly visible.
- Devices with terminal compartment lid (e.g. Series 96) must only be commissioned if the terminal compartment lid of the device is properly sealed.
- Connection cables and connectors must be protected from excessive or unintended pulling or pushing strain.
- Prevent dust deposits from forming on the devices.
- Metallic parts (e.g. housing, mounting devices) are to be integrated into the potential equalization to prevent electrostatic charge.

Maintenance

- No changes may be made to explosion-proof devices.
- Repairs may only be performed by persons trained for such work or by the manufacturer.
- Defective devices must be replaced immediately.
- Cyclical maintenance is generally not necessary.
- Depending on the environmental conditions, it may occasionally be necessary to clean the optical surfaces of the sensors.
 This cleaning must only be performed by persons trained for this task. We recommend using a soft, damp cloth. Cleaning agents that contain solvents must not be used.

Chemical resistance

- The sensors demonstrate good resistance against diluted (weak) acids and bases.
- Exposure to organic solvents is possible only under certain circumstances and only for short periods of time.
- Resistance to chemicals must be examined on a case by case basis.

Special conditions

- The sensor must be removed from the protective housing in order to connect the M8 connector. After the connection has been established, the sensor must be installed back into the protective housing properly. Operation without protective housing is not permitted.
- If the sensor is connected to the M8 connector and installed properly in the protective housing, the connector can no longer be unintentionally separated. Further mechanical protective measures are therefore not necessary.
- The devices must be installed in such a way that they are protected from direct exposure to UV rays (sunlight).

Application notes

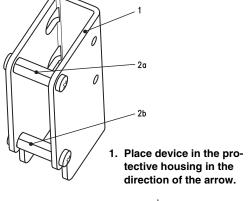

- For glossy surfaces (e.g. metals), the light beam should not be incident on the object surface at a right angle. A slight inclination is sufficient for preventing undesired direct reflections. This may result in a reduction in the scanning range.
- Objects should only be moved in laterally from the right or left. Moving in objects from the connector side or operating side is to be avoided.
- Outside of the scanning range, the sensor operates as an energetic diffuse reflection light scanner. Light objects can still be reliably detected up to the scanning range limit.
- The sensors are equipped with effective measures for the maximum avoidance of mutual interference should they be mounted opposite one another. Opposite mounting of multiple sensors of the same type should, however, absolutely be avoided.
