Subject to modifications.

**Warning!**

Dangerous electrical voltage!

**Before commencing the installation**

- Disconnect the power supply of the device.
- Ensure that the device cannot be accidentally restarted.
- Verify isolation from the supply.
- Earth and short circuit.
- Cover or enclose neighbouring units that are live.
- Follow the engineering instructions of the device concerned.
- Only suitably qualified personnel in accordance with EN 50110-1/-2 (DIN VDE 0105 Part 100) may work on this device.
- Before installation and before touching the device ensure that you are free of electrostatic charge.
- The functional earth (FE) must be connected to the protective earth (PE) or to the potential equalisation. The system installer is responsible for implementing this connection.
- Connecting cables and signal lines should be installed so that inductive or capacitive interference do not impair the automation functions.
- Install automation devices and related operating elements in such a way that they are well protected against unintentional operation.
- Suitable safety hardware and software measures should be implemented for the I/O interface so that a line or wire breakage on the signal side does not result in undefined states in the automation devices.
- Ensure a reliable electrical isolation of the low voltage for the 24 volt supply. Only use power supply units complying with IEC/HD 60364-4-41 (DIN VDE 0100 Part 410).
- Deviations of the mains voltage from the rated value must not exceed the tolerance limits given in the specifications, otherwise this may cause malfunction and dangerous operation.
- Emergency stop devices complying with IEC/EN 60204-1 must be effective in all operating modes of the automation devices. Unlatching the emergency-stop devices must not cause uncontrolled operation or restart.
- Measures should be taken to ensure the proper restart of programs interrupted after a voltage dip or failure. This should not cause dangerous operating states even for a short time. If necessary, emergency-stop devices should be implemented.
- Wherever faults in the automation system may cause damage to persons or property, external measures must be implemented to ensure a safe operating state in the event of a fault or malfunction (for example, by means of separate limit switches, mechanical interlocks etc.).

## Safety regulations

- The electrical installation must be carried out in accordance with the relevant regulations (e.g. with regard to cable cross sections, fuses, PE).
- All work relating to transport, installation, commissioning and maintenance must only be carried out by qualified personnel. (IEC/HD 60364 (DIN VDE 0100) and national work safety regulations).

## About this manual

### Reading conventions

Symbols used in this manual have the following meanings:

#### Attention!

Warns of minor damage to property.

#### Caution!

Warns of major damage to property, and minor injuries.

#### Warning!

Warns of major damage to property, and death or major injuries.

Draws your attention to interesting tips and supplementary information

### List of revisions

The following significant amendments have been introduced since previous issue:

Publication date	Page	Keyword	New	Changed
12/2013	162	Warns of switching inductive loads		✓

## 1 The XI/ON Station

### Dimensions

### Dimensions of gateways, , end plate and end bracket

Table 1: Dimensions of gateways, , end plate and end bracket

Electronics module	W x L x H [mm]
XN standard gateway (XN-GW...)	50.6 x 114.75 x 74.4
XNE ECO gateway (XNE-GWBR-...)	33.5 x 129 x 75
End plate (XN-ABPL)	9.2 x 114.4 x 48.4
End bracket (XN-WEW-35/2-SW)	8 x 56 x 47

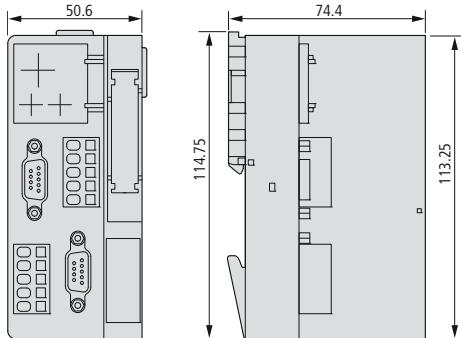

Figure 1: XN standard gateway (XN-GW...)

# 1 The XI/ON Station

## Dimensions

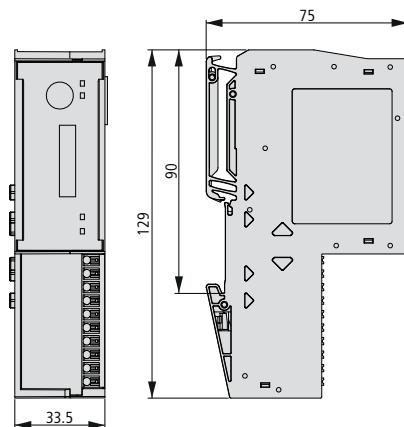

Figure 2: XNE ECO gateway (XNE-GWBR-...)

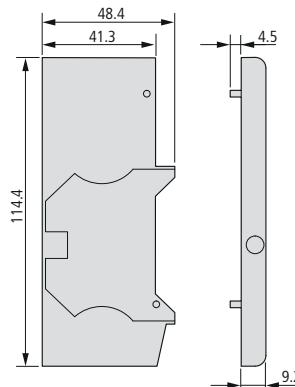

Figure 3: End plate (XN-ABPL)

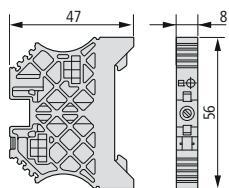

Figure 4: End bracket (XN-WEW-35/2-SW)

## Dimensions of base and electronics modules

Table 2: Dimensions of electronics modules

<b>Electronics module</b>	<b>W x L x H [mm]</b>
XN standard electronics module:	
Slice design	12.6 x 74.1 x 55.4
Block design (XN-16..., XN-32...)	100.8 x 74.1 x 55.4
XNE ECO electronics module:	
XNE-8DI-24VDC-P	13 x 129.5 x 74.5
XNE-8DO-24VDC-0.5A-P	
XNE-1SWIRE	
XNE-16DI-24VDC-P	13 x 161.5 x 74.5
XNE-16DO-24VDC-0.5A-P	
XNE-8AI-U/I-4PT/NI	
XNE-4AO-U/I	
XNE-2CNT-2PWM	

Table 3: Dimensions of base modules

<b>Base module</b>	<b>W x L x H [mm]</b>
Slice design with:	
3 connection levels (XN-S3..., XN-P3...)	12.6 x 117.6 x 49.9
4 connection levels (XN-S4..., XN-P4...)	12.6 x 128.9 x 49.9
6 connection levels (XN-S6...)	12.6 x 154.5 x 49.9
Block design with:	
3 connection levels (XN-B3...)	100.8 x 117.6 x 49.9
4 connection levels (XN-B4...)	100.8 x 128.9 x 49.9
6 connection levels (XN-B6...)	100.8 x 154.5 x 49.9

# 1 The XI/ON Station

## Technical data for the XI/ON station

### Technical data for the XI/ON station

#### Attention!

The auxiliary supply must meet the requirements for SELV (= Safety Extra Low Voltage) according to IEC 60364-4-41.

Table 4: Technical data for the XI/ON station

Designation	Value
Supply voltage/auxiliary supply	
Nominal value (provided for other modules)	24 V DC
Residual ripple	according to IEC/EN 61131-2
Electrical isolation ( $U_L$ to $U_{SYS}$ / $U_L$ to field bus/ $U_{SYS}$ to field bus)	Yes, via optocoupler
Environment/temperature	
Operating temperature, mounted horizontally	0...+55 °C
Operating temperature, mounted vertically	0...+55 °C
Storage temperature	-25...+85 °C
Relative humidity according to IEC/EN 60068-2-30	5...95 % (indoor), Level RH-2, no condensation (storage at 45 °C, no functional test)
Rating of XN standard enclosure <sup>2)</sup> for modules in slice design (max. possible power loss)	1.3 W
Rating of XN ECO enclosure <sup>2)</sup> for slice modules (max. possible power loss)	3 W
Rating of XN standard enclosure <sup>2)</sup> for block modules (max. possible power loss)	5 W
Corrosive gases	
SO <sub>2</sub>	10 ppm (rel. humidity < 75 %, no condensation)
H <sub>2</sub> S	1.0 ppm (rel. humidity < 75 %, no condensation)

1 The XI/ON Station  
Technical data for the XI/ON station

<b>Designation</b>	<b>Value</b>
Vibration resistance	
10...57 Hz, constant amplitude 0.075 mm, 1 g	yes
57...150 Hz, constant acceleration 1 g	yes
Vibration type	Variable frequency runs at a rate of change of 1 octave/min
Vibration duration	20 variable frequency runs per coordinate axis
Shock resistance according to IEC/EN 60068-2-27	18 shocks, half-sine 15 g peak value/11 ms, for both +/- directions per spatial coordinate
Repeated shock resistance according to IEC/EN 60068-2-29	1000 shocks, half sine 25 g peak value/6 ms, for both +/- directions per spatial coordinate
Drop and topple	
Fall height (weight < 10 kg)	1.0 m
Fall height (weight 10...40 kg)	0.5 m
Test runs	7
Instrument with packaging, electronics boards electrically tested	
Electromagnetic compatibility (EMC) according to IEC/EN 61000-6-2 (industrial)	
Static electricity according to IEC/EN 61000-4-2	
Air discharge (direct)	8 kV
Relay discharge (indirect)	4 kV
Electromagnetic HF fields according to IEC/EN 61000-4-3	10 V/m
Conducted interference, induced by HF fields according to IEC/EN 61000-4-6	10 V

# 1 The XI/ON Station

## Technical data for the XI/ON station

Designation	Value
Fast transients (burst) according to IEC/EN 61000-4-4	1 kV / 2 kV
Radiated interference according to IEC/EN 61000-6-4 (industrial)	according to IEC/CISPR 11 / EN 55011, Class A <sup>1)</sup>

- 1) The use in residential areas may lead to functional errors. Additional suppression measures are necessary!
- 2) XNE ECO enclosures are one-piece enclosures. The module electronics and the connection level cannot be separated.  
XN standard enclosures are two-piece enclosures. The module electronics are located in a separate enclosure and must be inserted into a suitable base module. The vast majority of the XN standard electronics modules can be combined with different base module types.

1 The XI/ON Station  
Technical data for the XI/ON station

Table 5:Approvals and tests for a XI/ON station

<b>Designation</b>	<b>Value</b>
Approvals <sup>1)</sup>	 
Tests (IEC/EN 61131-2)	
Cold	IEC/EN 60068-2-1
Dry heat	IEC/EN 60068-2-2
Damp heat, cyclical	IEC/EN 60068-2-30
Temperature changes	IEC/EN 60068-2-14
Operating life MTBF	120000 h <sup>2)</sup>
Removal/insertion cycles for electronics modules	20
Pollution level according to IEC/EN 60664 (IEC/EN 61131-2)	2
Degree of protection according to IEC/EN 60529	IP 20

- 1) The approvals of newer XI/ON modules can still be pending
- 2) The operational life of the relay modules is not given in hours. The relevant factor for the operational life of relay modules is the number of switching operations (see technical data for the relay modules).

# 1 The XI/ON Station

## Technical data for the terminals

### Technical data for the terminals

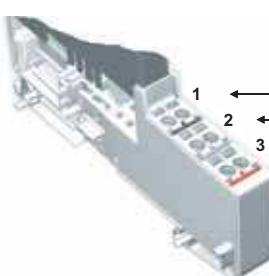

Table 6: Technical data for the terminals

Designation	XN gateways, base modules	XNE gateways, XNE electronics modules
Protection class	IP20	IP20
Insulation stripping length	8.0...9.0 mm / 0.32...0.36 inch	8.0...9.0 mm / 0.32...0.36 inch
Max. wire range	0.5...2.5 mm <sup>2</sup> / 0.0008...0.0039 inch <sup>2</sup> / AWG 24...AWG 14	0.14...1.5 mm <sup>2</sup> / 0.0002...0.0023 inch <sup>2</sup> / AWG 24...AWG 16
Crimpable wire		
"e" solid core H 07V-U	0.5...2.5 mm <sup>2</sup> / 0.0008...0.0039 inch <sup>2</sup>	0.25...1.5 mm <sup>2</sup> / 0.0004...0.0023 inch <sup>2</sup>
"f" flexible core H 07V-K	0.5...1.5 mm <sup>2</sup> / 0.0008...0.0023 inch <sup>2</sup>	0.25...1.5 mm <sup>2</sup> / 0.0004...0.0023 inch <sup>2</sup>
"f" with ferrules <b>without</b> plastic collar according to DIN 46228-1 (ferrules crimped gas-tight)	0.5...1.5 mm <sup>2</sup> / 0.0008...0.0023 inch <sup>2</sup>	0.25...1.5 mm <sup>2</sup> / 0.0004...0.0023 inch <sup>2</sup>
"f" with ferrules <b>with</b> plastic collar according to DIN 46228-1 (ferrules crimped gas-tight)	0.5...1.5 mm <sup>2</sup> / 0.0008...0.0023 inch <sup>2</sup>	0.25...0.75 mm <sup>2</sup> / 0.0004...0.0012 inch <sup>2</sup>
Test finger according to IEC/EN 60947-1	A1	A1
Measurement data	according to VDE 0611 Part 1/8.92 / IEC/EN 60947-7-1	according to VDE 0611 Part 1/8.92 / IEC/EN 60947-7-1
Rated voltage	250 V	250 V
Rated current	17.5 A	17.5 A
Rated cross section	1.5 mm <sup>2</sup>	1.5 mm <sup>2</sup>
Rated surge voltage	4 kV	4 kV
Pollution degree	2	2
Connection method in TOP direction	Tension clamp or screw connection	Push-in tension clamp terminals

# 1 The XI/ON Station

## Designations of the base modules

### Designations of the base modules

- XN-S3T-SBB: XI/ON
- XN-S3T-SBB: Slice
- XN-S3T-SBB: 3 connection rows
- XN-S3T-SBB: Tension clamp
- XN-S3T-SBB: Single Connectors
- XN-S3T-SBB: Bridged Connectors
- XN-S3T-SBB: Bridged Connectors

Figure 14: Example of a base module designation

Table 7: Abbreviations for base module designations

Identifier	Designation	Example
XN	Abbreviation for XI/ON	<b>XN</b> -B3S-SBB
B	Designation of base modules in block version ( <b>Block</b> )	XN- <b>B</b> 3S-SBB
S	Designation of base modules in slice version ( <b>Slice</b> )	XN- <b>S</b> 3T-SBB
P	Designation of base modules for feeding and bus refreshing modules ( <b>Power</b> )	XN- <b>P</b> 3T-SBB
3, 4, 6	Number of terminal rows.	XN-P <b>3</b> T-SBB
S	Designation of base modules with screw connection ( <b>Screw</b> )	XN-S3 <b>S</b> -SBB
T	Designation of base modules with tension clamp connection ( <b>Tension Clamp</b> )	XN-S3 <b>T</b> -SBB
x	Optionally <b>S</b> or <b>T</b> in the designation of base modules with screw or tension clamp connection ( <b>Screw/Tension</b> )	XN-S3 <b>x</b> -SBB
S	Unlinked connections on the same connection level (connection level 1 in this case) in a base module, for connecting signals ( <b>Single Connector</b> )	XN-S3T- <b>S</b> BB

## Designations of the base modules

Identifier	Designation	Example
B	Bridged connections on the same connection level in a base module, for voltage connections. ( <b>Bridged Connector</b> )	XN-S3T-SBB
B	Supplement to the designation of base modules for bus refreshing modules that are used within an XI/ON station, but not for supplying the gateway. ( <b>Bus Refreshing</b> )	XN-P4T-SBBC- <b>B</b>
C	Designation of a connection level that has a connection to a C-rail and can be used for a PE connection (only for specific base modules). ( <b>Cross Connection</b> )	XN-S4T-SBBC
CJ	Base module for XN-2AI-THERMO-PI with integrated Pt1000 for cold junction compensation. ( <b>Cold Junction Compensation</b> )	XN-S4T-SBBS- <b>CJ</b>

**Module designations and abbreviations**

Table 8: Key to module designations

Identifier	Designation	Example
<b>Analog input and output modules</b>		
AI	Analog input module	XN-1 <b>AI-U</b> (-10/0...+10VDC)
AO	Analog output module	XN-1 <b>AO-I</b> (0/4...20MA)
PT	Analog input module for connecting resistance thermometers with PT100, PT200, PT500 and PT1000 sensors with 2- and 3-wire measuring	XN-2AI- <b>PT</b> /NI-2/3
NI	Analog input module for connecting resistance thermometers with Ni100 and Ni1000 sensors with 2- and 3-wire measuring	XN-2AI-PT/ <b>NI</b> -2/3
PI	Potentially isolated (analog modules for thermocouples)	XN-2AI-THERMO- <b>PI</b>
<b>Supply modules</b>		
BR	Bus refreshing module	XN- <b>BR</b> -24VDC-D
PF	Power feeding module	XN- <b>PF</b> -24VDC-D
D	Diagnostics	XN- <b>BR</b> -24VDC- <b>D</b>
<b>Digital input and output modules</b>		
DI	Digital input module	XN-2 <b>DI</b> -24VDC-P
DO	Digital output module	XN-2 <b>DO</b> -24VDC-2A-P
N	Negative switching (sourcing)	XN-2DI-24VDC- <b>N</b>
P	Positive switching	XN-2DI-24VDC- <b>P</b>
<b>Relay modules</b>		
R	Relay module	XN-2DO- <b>R</b> -NC
CO	Change over	XN-2DO-R- <b>CO</b>
NC	Normally closed	XN-2DO-R- <b>NC</b>
NO	Normally open	XN-2DO-R- <b>NO</b>

# 1 The XI/ON Station

## Wiring of the XI/ON modules

### Wiring of the XI/ON modules

The used method when wiring the XI/ON modules depends on the used connection engineering:

- The base modules use spring-finger contacts in the following versions:
  - Base modules using tension clamp connection technology (XN-...**T**-...)
  - Base modules using screw connection technology (XN-...**S**-...)
- The XNE ECO modules use direct push-in contacts:
  - Push-in tension clamp terminals

The XNE ECO modules can be easily combined with the base modules using tension clamp connection technology (XN-...**T**-...). A connection is **not** possible on base modules using screw connection technology (XN-...**S**-...).

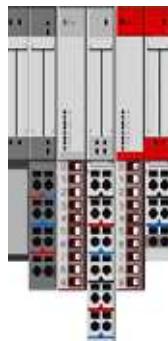

Figure 15: XNE ECO modules combined with tension clamp contact modules

**Wiring of tension clamp connections**

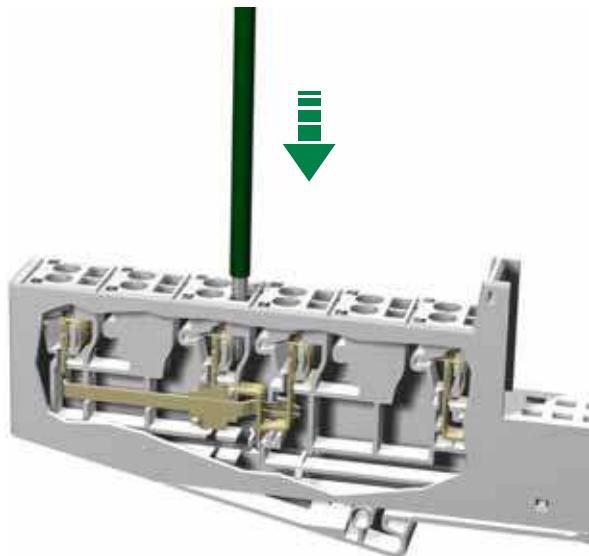

Figure 16: Tension clamp connections

**Method:**

- ▶ Insert a screwdriver into the rectangular opening located immediately above the connection level of the base module. When you feel a slight resistance, push the screwdriver into the opening until it comes up against a stop. This opens a tension clamp on the inside of the connection level.
- ▶ Insert the wiring into the round opening located directly below the rectangular opening, until the wire comes up against a stop.
- ▶ Remove the screwdriver; the tension clamp closes and secures the wire.

## 1 The XI/ON Station

### Wiring of the XI/ON modules

#### Wiring of screw connections

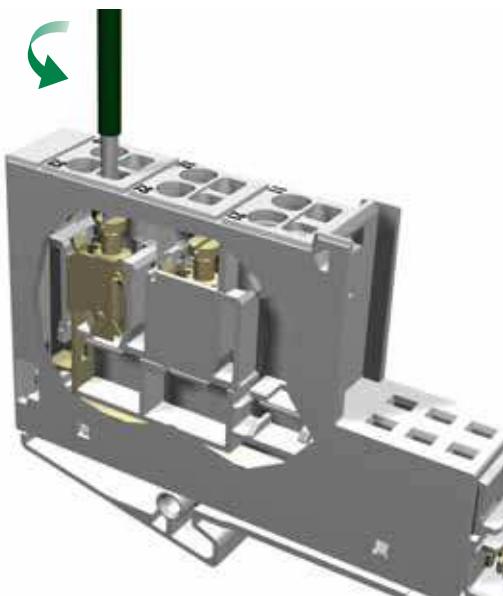

Figure 17: Screw connections

#### Method:

- ▶ Place the screwdriver in the rectangular opening of a connection level on the base module. Turn the screw counterclockwise as far as possible, without fully removing it.
- ▶ Insert the wire in to the round opening, located directly below the rectangular opening, until it comes up against a stop.
- ▶ Turn the screw clockwise until the wire is fully secured, and cannot be pulled out.

**Handling the push-in tension clamp terminals of the XNE ECO modules**

**Insertion of the conductor**

The conductor is simply pushed into the corresponding contact.

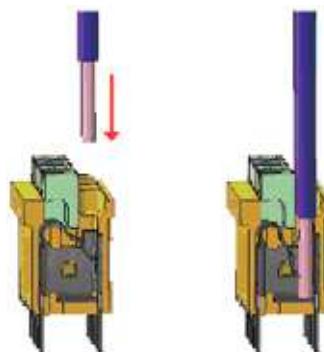

Figure 18: Insertion of the conductor

**Removal of the conductor**

The conductor can be removed from the corresponding contact by pressing the release mechanism, e.g. with a screw driver.

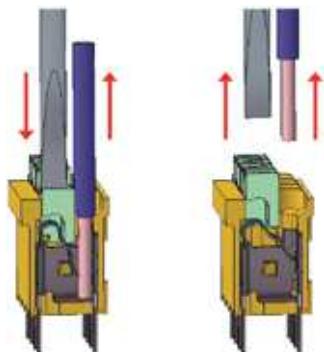

Figure 19: Removal of the conductor

## 1 The XI/ON Station

### Wiring of the XI/ON modules

## 2 The supply modules

### Bus refreshing modules

The bus refreshing modules provide:

- 5 V DC for the internal XI/ON module bus and the neighbouring gateway.
- 24 V DC (permissible range according to IEC/EN 61131-2) as the supply for the module electronics and the field. This 24 V DC supply voltage is distributed throughout the XI/ON station (→ “Internal connections in an XI/ON station”, page 56) as a separate cable.

They are electrically isolated from the adjacent supply group on the left.

#### Attention!

If the XI/ON station contains a gateway without an integrated power supply unit (XN-GW-...), the first bus refreshing module must be fitted directly to the right of a gateway. This provides the 5 V DC power supply to the gateway when connected to a special base module (→ “Base modules for XN-BR-24VDC-D”, page 39).

The use of supply modules means that it is not necessary to make individual connections of the field and/or system supply voltage to each individual XI/ON I/O-module.

Depending on the application, potential groups can thus be formed by the planned use of supply modules. Supply modules are built as XN standard electronics modules in slice design. They are completed by base modules with tension clamp or screw connection. The ash-grey cover of the base modules for supply modules makes them stand out against the base modules for the XI/ON I/O-modules.

## 2 The supply modules

### Bus refreshing modules

#### **LED indicators**

The error and diagnostics messages are provided by the indicator LEDs of the module. The corresponding diagnostics information is also transmitted to the gateway as diagnostics bits.

**XN-BR-24VDC-D**

### XN-BR-24VDC-D

#### Technical data

Table 9: XN-BR-24VDC-D

Designation	Value
Field supply	
$U_L$ nominal value (range) (externally provided and internally filtered): <ul style="list-style-type: none"><li>• Supply for module electronics</li><li>• Field supply</li></ul>	24 V DC (18...30 V DC)
$I_L$ max. field current	10 A
Insulation voltage ( $U_L$ to $U_{SYS}$ / $U_L$ to module bus / $U_L$ to FE)	500 V <sub>rms</sub>
System supply	
$U_{SYS}$ nominal value (range) (externally provided)	24 V DC (18...30 V DC)
$U_{MB}$ nominal value (range) ( $U_{SYS}$ internally converted): <ul style="list-style-type: none"><li>• Gateway supply</li><li>• Module bus supply</li></ul>	5 V DC (4.7...5.3 V DC)
$I_{MB}$ (supply to the module bus participants)	1.5 A
Insulation voltage ( $U_{SYS}$ to $U_L$ / $U_{SYS}$ to module bus / $U_{SYS}$ to FE)	500 V <sub>rms</sub>
Ripple	< 5 %
Residual ripple, according to	IEC/EN 61131-2

## Diagnostic messages

The diagnostics functions monitor the supply voltages that have to be provided by the user (system and field supplies) for undervoltage. They indicate any error through the DIA LED and send corresponding diagnostics information to the gateway.

The module features the following diagnostics data:

Table 10: Diagnostics through the LEDs

<b>LED</b>	<b>Display</b>	<b>Meaning</b>	<b>Remedy</b>
<b>DIA</b>	Red, flashing, 0.5 Hz	Fault in field supply $U_L$ or system supply $U_{sys}$	Check the wiring of the system supply for the module bus and the field supply. Check that the voltages of the system supply and the field supply are within the permissible tolerances.
	Red	Failure of module bus communication	Check whether more than two adjacent electronics modules have been removed. Check the wiring of the system supply for the module bus.
	OFF	No fault indication or diagnostics	–
<b>Vcc</b>	Green	5 Vcc supply voltage for module bus is OK	–
	OFF	5 Vcc supply voltage for module bus has a fault	Check the voltage and the wiring for the system supply.

## 2 The supply modules

XN-BR-24VDC-D

LED	Display	Meaning	Remedy
<b>Sys</b>	Green	System supply from external power supply is OK.	–
	OFF	System supply from external power supply has a fault.	Check the wiring of the system supply. Check the external power supply.
<b>U<sub>L</sub></b>	Green	Field supply from external power supply is OK.	–
	OFF	Field supply from external power supply has a fault.	Check the wiring of the field supply. Check the external power supply.

- Module bus voltage warning  
Monitoring of the externally provided system supply voltage ( $U_{sys} = 24$  V DC). The system supply is converted (24 V DC  $\Rightarrow$  5 V).
- Field voltage missing  
Monitoring of the externally provided field supply voltage.  
 $U_L = 24$  V DC

**Base modules**

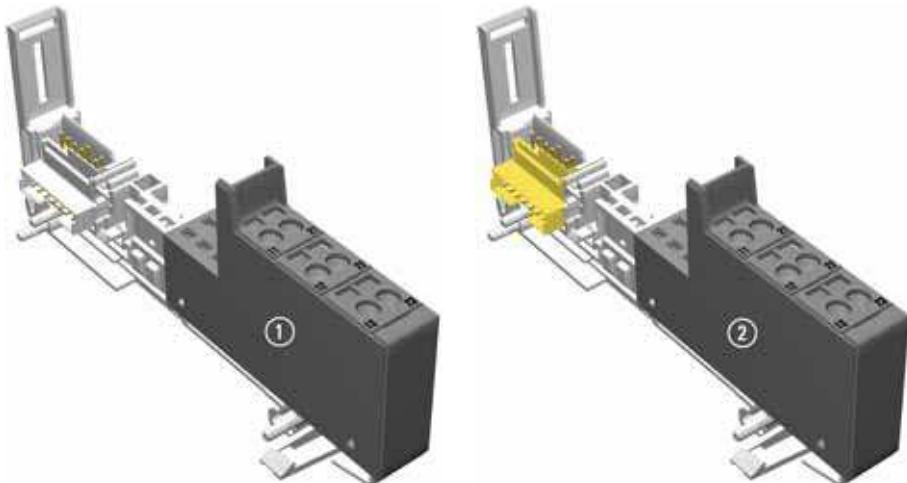

Figure 22: Base modules for XN-BR-24VDC-D

- ① Base module with gateway supply
- ② Base module without gateway supply

	<b>Base modules with gateway supply</b>	<b>Base modules without gateway supply</b>
With tension clamp connection	XN-P3T-SBB XN-P4T-SBBC	XN-P3T-SBB-B XN-P4T-SBBC-B
With screw connection	XN-P3S-SBB XN-P4S-SBBC	XN-P3S-SBB-B XN-P4S-SBBC-B

**Attention!**

Only the base modules XN-P3x-SBB or XN-P4x-SBBC can be used to supply a gateway without an integrated supply unit (XN-GW-...). The bus refreshing module is to be found immediately to the right of the gateway.

## 2 The supply modules

### XN-BR-24VDC-D

The base modules with or without gateway supply can be distinguished as follows.

## 2 The supply modules

### Power feeding modules

#### Power feeding modules

The power feeding modules are used to supply the various XI/ON modules with the field voltage of 24 V DC (XN-PF-24VDC-D) or 120/230 V AC (XN-PF-120/230VAC-D). They are used when different potential groups need to be set up within a XI/ON station, or in the event that the supply would otherwise be inadequate for the rated current requirements of the XI/ON modules. They are electrically isolated from the adjacent supply group on the left.

#### Warning!

Power feeding modules cannot be used to provide the 5 V DC supply for XI/ON gateways.

The use of power feeding modules means that it is not necessary to provide a supply feed to each individual XI/ON module.

Power feeding modules are built as XN standard electronics modules in slice design. They are completed by base modules with tension clamp or screw connection.

The ash-grey cover of the base modules for power feeding modules make them clearly distinguishable from the base modules for the XI/ON I/O modules.

#### LED indicators

The error and diagnostics messages are provided by the various LEDs on the module. The corresponding diagnostics information is transmitted to the gateway as diagnostics bits.

## 2 The supply modules

### Supply modules in a sample station

#### Supply modules in a sample station

The following diagram shows various potential groups within an XI/ON station. The 24 V DC or 230 V AC voltage is fed in through the internal supply cable (→ “Internal connections in an XI/ON station”, page 56):

#### Basismodule

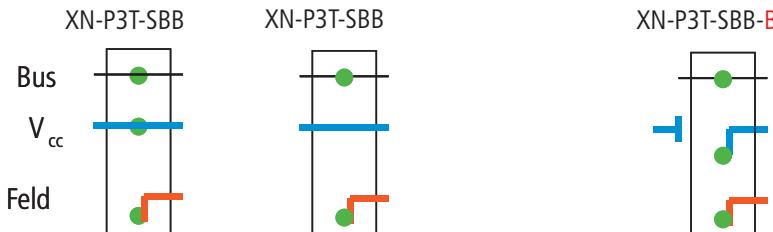

Figure 36: Potential groups in a sample station

## 2 The supply modules

### Internal connections in an XI/ON station

#### Internal connections in an XI/ON station

The following diagram shows the internal data and supply cables for an XI/ON station:

Figure 37: Internal connections in an XI/ON station

- ① This type of connection is known as a C-rail, and is led through all the base modules to the next supply module. All modules with a C in the designation have an electrical connection to the C-rail (e.g. XN-S4T-SBCS). The connections to the C-rail are marked by a black edge. The C-rail can be used as a protective earth (PE), or can have a maximum potential of 24 V.
- ② These connections provide the supply voltage  $U_L$ . The supply voltage  $U_L$  is used for the field supply, and also as a supply for the module electronics. The majority of XI/ON modules require this 24 V DC supply in addition to the 5 V DC module bus voltage.
- ③ This 7-core module bus connection includes the 5 V DC module bus voltage as well as the data cables.

## 3 Digital input modules

### General

Digital input modules (DI) detect electrical High (**1**) and Low (**0**) levels and transmit the corresponding digital value to the gateway, via the internal module bus.

The electronics on the module bus side of the digital input modules is electrically isolated from the field level by optocouplers. Polarity reversal protection is also provided.

Digital input modules are built in both slice and block designs. XN standard electronics modules are completed by base modules with tension clamp or screw connection. XNE ECO electronics modules do not require a base module.

There are no parameter setting options for the digital input modules.

### LED indicators

The channel status is indicated by the status LED. Error messages from the I/O level are made on a module basis, through the collective **DIA** indicator LED.

If the **DIA** LED is permanently red, this indicates that the module bus communication for the digital input module has failed.

### 3 Digital input modules

#### General

Table 15: Module summary

	No. of channels	Positive switching
XN-2DI-24VDC-P	2	yes
XN-2DI-24VDC-N	2	no
XN-2DI-120/230VAC	2	-
XN-4DI-24VDC-P	4	yes
XN-4DI-24VDC-N	4	no
XN-16DI-24VDC-P	16	yes
XN-32DI-24VDC-P	32	yes
XNE-8DI-24V-P	8	yes
XNE-16DI-24V-P	16	yes

### **3 Digital input modules**

Overview: base modules for digital input modules

## 4 Digital output modules

### General

Digital output modules (DO) receive output values from the gateway via the internal module bus. The modules convert the values and output the corresponding Low (**0**) or High (**1**) values to the field level.

The outputs are implemented according to IEC/EN 61131-2.

The electronics on the module bus side of a digital output module is electrically isolated from the field level by optocouplers.

Digital output modules are built in both slice and block designs. XN standard electronics modules are completed by base modules with tension clamp or screw connection. XNE ECO electronics modules do not require a base module.

There are no parameter setting options for the digital output modules.

#### Attention!

External suppression components should be fitted when using inductive loads.

## 4 Digital output modules

### General

#### LED indicators

The channel status is indicated by the status LED. Error messages from the I/O level are made on a module basis, through the collective **DIA** indicator LED. The corresponding diagnostics information is transmitted to the gateway as diagnostics bits.

If the **DIA** LED is permanently red, this indicates that the module bus communication for the digital output module has failed.

Table 34: Module summary

	No. of channels	Positive switching	Max. output current per channel	Electrically isolated
XN-2DO-24VDC-0.5A-P	2	yes	0.5 A	yes
XN-2DO-24VDC-0.5A-N	2	no	0.5 A	yes

### Technical data

Table 35: XN-2DO-24VDC-0.5A-P

Designation	Value
Number of channels	2
Nominal supply from supply terminal $U_L$ (range)	24 V DC (18...30 V DC)
Nominal current consumption from supply terminal $I_L^{1)2)}$	$\leq 20 \text{ mA}$ (when load current = 0 mA)
Nominal current consumption from module bus $I_{MB}^{2)}$	$\leq 32 \text{ mA}$
Insulation voltage (channels to module bus)	500 V <sub>rms</sub>
Power loss	Normally 1 W
Output voltage	
High level (the output is switched on and loaded)	$> U_L - 1 \text{ V DC}$
Output current (to supply the actuators/the output is switched on)	
High level (nominal value)	0.5 A
High level (permissible range)	$< 0.6 \text{ A}$
Permissible total current over all outputs	$\leq 1 \text{ A}$
Simultaneity factor	100 %
Output delay for signal change and resistive load ( $R_{LO} < 1 \text{ k}\Omega$ )	
From Low to High level	$< 100 \mu\text{s}$
From High to Low level	$< 100 \mu\text{s}$
Load resistance range	$> 48 \Omega$
Connectable equipment	
Resistive load $R_{LO}$	$> 48 \Omega$
Inductive load $R_{LI}$	$< 1.2 \text{ H}$
Lamp load $R_{LL}$	$< 3 \text{ W}$
Switching frequency	
With resistive load ( $R_{LO} < 1 \text{ k}\Omega$ )	$< 5000 \text{ Hz}$

Designation	Value
With inductive load	< 2 Hz
With lamp load	< 10 Hz
Output according to IEC/EN 61131-2	Protected, → Page 229
Restart after removal of a short-circuit	Automatic

- 1) The supply terminal ( $U_L$ ) provides the current for the module electronics and for the consumers on the outputs. The overall current that is required for each module is the sum of all the individual currents.
- 2) A part of the electronics of the XI/ON module is supplied from the module bus voltage (5 V DC), the rest from the supply terminal ( $U_L$ ).

## 4 Digital output modules

XN-2DO-24VDC-0.5A-P

### Diagnostic messages

Table 36: Diagnostics through the LEDs

LED	Display	Meaning	Remedy
DIA	Red, flashing, 0.5 Hz	Diagnostics available	Remove the short-circuit on the corresponding channel.
	Red	Failure of module bus communication	Check whether more than two adjacent electronics modules have been removed.
	OFF	No fault indication or diagnostics	–
11	Green	Status of channel 1 = <b>1</b>	–
	OFF	Status of channel 1 = <b>0</b>	–
21	Green	Status of channel 2 = <b>1</b>	–
	OFF	Status of channel 2 = <b>0</b>	–

The module features the following diagnostics data per channel:

- **Overcurrent** (short-circuit)

#### Technical data

Table 39: XN-2DO-24VDC-2A-P

Designation	Value
Number of channels	2
Nominal supply from supply terminal $U_L$ (range)	24 V DC (18...30 V DC)
Nominal current consumption from supply terminal $I_L^{1)2)}$	$\leq 50 \text{ mA}$ (when load current = 0 mA)
Nominal current consumption from module bus $I_{MB}^{2)}$	$\leq 33 \text{ mA}$
Insulation voltage (channels to module bus)	500 V <sub>rms</sub>
Power loss	Normally 1 W
Output voltage	
High level (the output is switched on and loaded)	$> U_L - 1 \text{ V DC}$
Output current (to supply the actuators/the output is switched on)	
High level (nominal value)	2 A
High level (permissible range)	$< 2.4 \text{ A}$
Value for inductive load (1.2 H)	$< 1 \text{ A}$
Permissible total current over all outputs	$\leq 4 \text{ A}$
Simultaneity factor	100 %
Output delay for signal change and resistive load ( $R_{LO} < 1 \text{ k}\Omega$ )	
From Low to High level	$< 100 \mu\text{s}$
From High to Low level	$< 100 \mu\text{s}$
Load resistance range	$> 12 \Omega$
Connectable equipment	
Resistive load $R_{LO}$	$> 12 \Omega$
Inductive load $R_{LI}$	$< 1.2 \text{ H}$
Lamp load $R_{LL}$	$< 6 \text{ W}$

Designation	Value
Switching frequency	
With resistive load ( $R_{LO} < 1 \text{ k}\Omega$ )	< 5000 Hz
With inductive load	< 2 Hz
With lamp load	< 10 Hz
Output according to IEC/EN 61131-2	Protected, → Page 229
Restart after removal of a short-circuit	Automatic

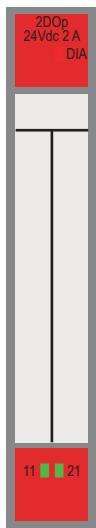

- 1) The supply terminal ( $U_L$ ) provides the current for the module electronics and for the consumers on the outputs. The overall current that is required for each module is the sum of all the individual currents.
- 2) A part of the electronics of the XI/ON module is supplied from the module bus voltage (5 V DC), the rest from the supply terminal ( $U_L$ ).

## 4 Digital output modules

XN-2DO-24VDC-2A-P

### Diagnostic messages

Table 40: Diagnostics through the LEDs

LED	Display	Meaning	Remedy
DIA	Red, flashing, 0.5 Hz	Diagnostics available	Remove the short-circuit on the corresponding channel.
	Red	Failure of module bus communication	Check whether more than two adjacent electronics modules have been removed.
	OFF	No fault indication or diagnostics	–
11	Green	Status of channel 1 = <b>1</b>	–
	OFF	Status of channel 1 = <b>0</b>	–
21	Green	Status of channel 2 = <b>1</b>	–
	OFF	Status of channel 2 = <b>0</b>	–

The module features the following diagnostics data per channel:

- **Overcurrent** (short-circuit)

**Base modules**

### XN-2DO-120/230VAC-0.5A

#### Technical data

Table 41: XN-2DO-120/230VAC-0.5A

Designation	Value
Number of channels	2
Nominal supply from supply terminal $U_L$ (range)	120 V AC (102...132 V AC) 230 V AC (195.5...253 V AC)
Frequency range	45...65 Hz
Nominal current consumption from supply terminal $I_L^{1 2)}$	$\leq 20$ mA (when load current = 0 mA)
Nominal current consumption from module bus $I_{MB}^{2)}$	$\leq 35$ mA
Insulation voltage (channels to module bus)	1500 V <sub>rms</sub>
Power loss	Normally 1 W
Output voltage	
High level (the output is switched on and loaded)	$> U_L - 1$ V DC (triac with zero-crossing switching)
Voltage drop with channel switched on	$\leq 2$ V
Output current (to supply the actuators/ the output is switched on)	
High level (nominal value)	0.5 A (pay attention to the derating)
High level (permissible range)	0.02...0.5 A
Low level	$< 1.5$ mA
Derating (maximum load)	At 40 °C: 1 A (per channel 0.5 A) At 50 °C: 0.75 A (per channel 0.375 A) At 55 °C: 0.5 A (per channel 0.25 A)
Leakage current (with channel switched on and switched off)	$\leq 1.5$ mA
Fusing	500 mA FF
Peak current	8 A (one period at 60 Hz)
Simultaneity factor	100 % (pay attention to the derating)

Designation	Value
Output delay for signal change and resistive load	
From Low to High level	< T/2 + 1 ms
From High to Low level	< T/2 + 1 ms
Load resistance range	At 120 V AC: 240 Ω...6 kΩ At 230 V AC: 460 Ω...11.5 kΩ

- 1) The supply terminal ( $U_L$ ) provides the current for the module electronics and for the consumers on the outputs. The overall current that is required for each module is the sum of all the individual currents.
- 2) A part of the electronics of the XI/ON module is supplied from the module bus voltage (5 V DC), the rest from the supply terminal ( $U_L$ ).

Leakage currents can produce a voltage at the output, even in the switched-off state.

## 4 Digital output modules

### XN-2DO-120/230VAC-0.5A

#### Diagnostics messages

LED	Display	Meaning	Remedy
<b>DIA</b>	Red	Failure of module bus communication	Check whether more than two adjacent electronics modules have been removed.
	OFF	No fault indication or diagnostics	-
<b>11</b>	Green	Status of channel 1 = <b>ON</b>	-
	OFF	Status of channel 1 = <b>OFF</b>	-
<b>21</b>	Green	Status of channel 2 = <b>ON</b>	-
	OFF	Status of channel 2 = <b>OFF</b>	-

The display elements are supplied from the field voltage (not from the module bus voltage). They will therefore only indicate the switching status correctly if this voltage is fully present on the power feeding module.

#### Diagnostics data

None

#### Module parameters

None

- 1) The supply terminal ( $U_L$ ) provides the current for the module electronics and for the consumers on the outputs. The electrical connection for the switched loads to ground  $GND_L$  must be made modular external. The overall current that is required for each module is the sum of all the individual currents.
- 2) A part of the electronics of the XI/ON module is supplied from the module bus voltage (5 V DC), the rest from the supply terminal ( $U_L$ ).
- 3) Two outputs can be connected in parallel to increase the maximum output current to 1 A.

## 5 Relay modules

### General

The XI/ON relay modules (R) receive output values from the gateway via the internal module bus. The modules convert these values and transmit the appropriate switching states per channel to the field level via the base module.

Relay modules are suitable for solenoid valves, DC contactors, and signal lamps, in the nominal load voltage range 24 V DC/V AC...230 V AC.

Relay modules are fitted with reverse polarity protection, and electrically isolated from the supply voltage.

Relay modules are built as XN standard electronics modules in slice design. They are completed by base modules with tension clamp or screw connection.

There are no parameter setting options for relay modules.

### LED indicators

Error messages from the I/O level are made on a module basis, through the collective **DIA** indicator LED. The corresponding diagnostics information is transmitted to the gateway as diagnostics bits. If the **DIA** LED is permanently red, this indicates that the module bus communication has failed for the relay modules.

### Load limit curve for resistive load

For 1000 switching actions, not continuous arc may occur that burns for more than > 10 ms.

## 5 Relay modules

### General

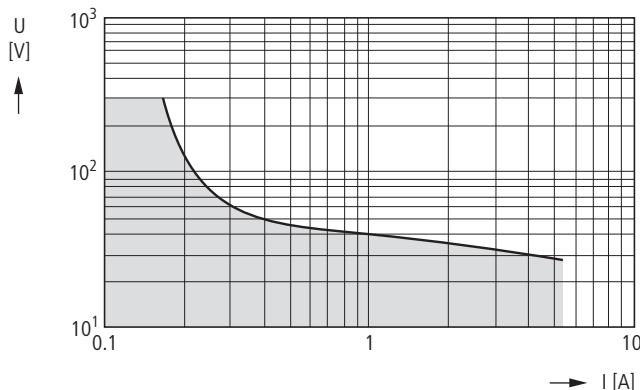

Figure 119: Definition of the load limit curve

#### Attention!

When using relay modules, a standard module representation should be avoided as far as possible. Otherwise, if relay modules are swapped (changeover/N/C/N/O) a short-circuit could be caused that destroys the module.

#### Attention!

When switching inductive loads, suppression components have to be placed at the load to avoid EMC influence.

For EMC suppression RC components have shown advantages because of their dynamic response. The use of varistors is not always sufficient.

**Attention!** To avoid interferences in analog I/O modules and in technology modules (can be caused when relay modules switch loads):

- Do **not** place analog I/O modules and technology modules contiguous to relay modules.
- Suppress interferences of the switch contact externally.

## 6 Integration in PROFIBUS-DP

### Process input data / process output data

The process data are transmitted byte-wise (8-Bit) across the PROFIBUS. The digital module types have 1 bit of process data for each channel. This bit indicates the channel status (digital input) or fixes the channel status (digital output/relay).

The digital input modules only provide process input data.

The digital output modules and relay modules only receive process output data.

Process data from modules with a sum of 8 channels or less can be bundled together as 1 byte (8 bits). This reduces the total amount of process data. Bundling the process data in this way is known as **Packing**.

The packing of the modules is arranged by a software tool during the project engineering phase for the XI/ON station. A detailed description with corresponding examples can be found in the manual:

- User Manual XI/ON:  
Gateways for PROFIBUS-DP

You can find the latest GSD files on our home page ([www.eaton-automation.com](http://www.eaton-automation.com)), under „DOWNLOADS“.

## 6 Integration in PROFIBUS-DP

### Process input data / process output data

#### Examples for allocation of the process data bits to the terminals

The assignment of the channels to the individual process data bits is generally in ascending order. The data can belong to various modules because of the option of bundling the data of 2 or 4-channel modules. The modules must not necessarily be located alongside one another. The least significant bits are invalid if not all 8 bits of a process data byte are filled out.

#### Example 1

The following overview of the process input data of two **packed** XN-4DI-24VDC-P modules and the corresponding terminal numbers of the connection level:

Table 58: Example of a terminal number/process input data assignment

Byte 0	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Terminal numbers of Byte 0	24	14	21	11	24	14	21	11
Second module XN-4DI-24VDC-P					First module XN-4DI-24VDC-P			

### **Example 2**

The following overview of the process input data of a XN-32DI-24VDC-P module and the corresponding terminal numbers of the connection level:

Table 59: Example of a terminal number/process input data assignment

	<b>Bit 7</b>	<b>Bit 6</b>	<b>Bit 5</b>	<b>Bit 4</b>	<b>Bit 3</b>	<b>Bit 2</b>	<b>Bit 1</b>	<b>Bit 0</b>
Terminal numbers of Byte 0	81	71	61	51	41	31	21	11
Terminal numbers of Byte 1	161	151	141	131	121	111	101	91

## 6 Integration in PROFIBUS-DP

### Diagnostics

#### Diagnostics

The digital input modules do not provide diagnostics data.

The digital output modules and supply modules do provide diagnostics messages:

Module type	Diagnostics message	Position in diagnostics byte	Meaning
XN-2DO-24VDC-0.5A-P	Overcurrent	Bit 0	
XN-2DO-24VDC-0.5A-N			
XN-2DO-24VDC-2A-P			
XN-4DO-24VDC-0.5A-P	ovrcurr/shrt-circ ( $\geq 1$ of K1-4)	Bit 0	There is a short-circuit on at least one of channels 1...4.
XN-16DO-24VDC-0.5A-P	ovrcurr/shrt-circ ( $\geq 1$ of K1-4)	Bit 0	There is a short-circuit on at least one channel in the group of 4.
	ovrcurr/shrt-circ ( $\geq 1$ of K5-8)	Bit1	
	ovrcurr/shrt-circ ( $\geq 1$ of K9-12)	Bit2	
	ovrcurr/shrt-circ ( $\geq 1$ of K13-16)	Bit3	

Module type	Diagnostics message	Position in diagnostics byte	Meaning
XN-32DO-24VDC-0.5A-P	ovrcurr/shrt-circ (≥1 of K1-4)	Bit 0	There is a short-circuit on at least one channel in the group of 4.
	ovrcurr/shrt-circ (≥1 of K5-8)	Bit1	
	ovrcurr/shrt-circ (≥1 of K9-12)	Bit2	
	ovrcurr/shrt-circ (≥1 of K13-16)	Bit3	
	ovrcurr/shrt-circ (≥1 of K17-20)	Bit4	
	ovrcurr/shrt-circ (≥1 of K21-24)	Bit5	
	ovrcurr/shrt-circ (≥1 of K25-28)	Bit6	
	ovrcurr/shrt-circ (≥1 of K29-32)	Bit 7	

XN-2DO-120/230VAC-0.5A, XNE-8DO-24VDC-0.5A-P and XNE-16DO-24VDC-0.5A-P do not provide diagnostics data.

## 6 Integration in PROFIBUS-DP

### Parameters

#### Parameters

There are no settable parameters for the digital input modules and output modules, or the relay modules.

However, please note that all the modules that appear in the **Standard module representation** during the project engineering planning with a software tool will occupy one parameter byte.

This parameter byte contains the number of other parameter bytes for the modules.

In the case of the digital input modules and output modules, or the relay modules, the value of the parameter byte is always 00<sub>hex</sub>.

Furthermore, please note that the response of the digital outputs in a fault condition (change of module, wrong module replaced, fieldbus error) can be defined through gateway parameters.

The description of these gateway parameters can be found in the manual:

- User Manual XI/ON:  
Gateways for PROFIBUS-DP

## 7 Integration in CANopen

### Process input data/ process output data

The digital module types have 1 bit of process data for each channel. This bit indicates the channel status (digital input) or fixes the channel status (digital output/relay).

The digital input modules only provide process input data.

The digital output modules and relay modules only receive process output data.

Objects, which can be defined by the Device Profile for I/O-Devices CiA DS-401, can be used to display the channel values as groups of 32, 16, 8 bits or as a single display of the values.

You can find the latest EDS files on our home page ([www.eaton-automation.com](http://www.eaton-automation.com)), under „DOWNLOADS“.

## 7 Integration in CANopen

### Objects for reading the process input data

#### Objects for reading the process input data

#### Overview

The objects indicate the process input values for each digital input channel in an XI/ON station.

The user has the option of choosing between 4 different formats for the representation of the values:

- Only one channel is displayed per Sub-index (Objects  $6020_{\text{hex}}$ ,  $6021_{\text{hex}}$  and  $6022_{\text{hex}}$ )
- 8 channels are displayed per Sub-index (Object  $6000_{\text{hex}}$ ).
- 16 channels are displayed per Sub-index (Object  $6100_{\text{hex}}$ ).
- 32 channels are displayed per Sub-index (Object  $6120_{\text{hex}}$ ).

Table 61: Objects for the process input data

Index (hex)	Page	Name
$6000_{\text{hex}}$	→ Page 197	Read Input 8 Bit
$6020_{\text{hex}}$	→ Page 198	Read Input Bit (1...128)
$6021_{\text{hex}}$	→ Page 198	Read Input Bit (129...256)
$6022_{\text{hex}}$	→ Page 198	Read Input Bit (257...288)
$6100_{\text{hex}}$	→ Page 199	Read Input 16 Bit
$6120_{\text{hex}}$	→ Page 200	Read Input 32 Bit

### **6000<sub>hex</sub> Read Input 8 Bit**

The object presents the values for the digital input modules in 8-bit groups.

A total of 36 groups (each 8-bit) can be displayed (288 digital input channels).

A PDO-Mapping of this object is always made automatically as a default for the first 8 sub-indices. This corresponds to 64 digital input channels.

If more than 64 input channels are present, then the **PDO-Mapping** must be carried out by the user.

Table 62: Object 6000<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Read Input 8 Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	Unsigned8
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	ro
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	No

## 7 Integration in CANopen

### Objects for reading the process input data

#### **6020<sub>hex</sub> Read Input Bit (1...128)**

#### **6021<sub>hex</sub> Read Input Bit (129...256)**

#### **6022<sub>hex</sub> Read Input Bit (257...288)**

The objects are a bit-wise representation of the values of the digital input modules. Each Sub-index for these objects is a Boolean value.

A total of 128 bits can be represented (128 digital input channels).

If more than 128 input channels are present, then Object 6021<sub>hex</sub> is used.

If more than 256 input channels are present, then Object 6022<sub>hex</sub> is used.

Since the number of digital input channels in a station is limited to 288, it is not possible to make use of the complete range of the array in Object 6022<sub>hex</sub>.

Table 63: Object 6020<sub>hex</sub> , 6021<sub>hex</sub>, 6022<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Read Input Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	Boolean
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	ro
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	No

### **6100<sub>hex</sub> Read Input 16 Bit**

The object presents the values for the digital input modules in 16-bit groups.

A total of 18 groups (each 16-bit) can be displayed (288 digital input channels).

Table 64: Object 6100<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Read Input 16 Bit

	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	ro
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	No

## Objects for writing the process output data

### Overview

The objects indicate the process output values for each digital output channel in an XI/ON station.

The user has the option of choosing between 4 different formats for the representation of the values:

- Only one output channel is displayed per Sub-index (Objects 6020<sub>hex</sub>, 6021<sub>hex</sub> and 6022<sub>hex</sub>).
- 8 output channel values are displayed per Sub-index (Object 6000<sub>hex</sub>).
- 16 output channel values are displayed per Sub-index (Object 6100<sub>hex</sub>).
- 32 output channel values are displayed per Sub-index (Object 6120<sub>hex</sub>).

Table 66: Objects for the process output data

Index (hex)	Page	Name
6200 <sub>hex</sub>	→ Page 202	Write Output 8 Bit
6220 <sub>hex</sub>	→ Page 203	Write Output Bit (1...128)
6221 <sub>hex</sub>	→ Page 203	Write Output Bit (129...256)
6222 <sub>hex</sub>	→ Page 203	Write Output Bit (257...288)
6300 <sub>hex</sub>	→ Page 204	Write Output 16 Bit
6320 <sub>hex</sub>	→ Page 205	Write Output 32 Bit

## 7 Integration in CANopen

### Objects for writing the process output data

#### **6200<sub>hex</sub> Write Output 8 Bit**

The object presents the values for the digital output modules in 8-bit groups.

A total of 36 groups (each 8-bit) can be defined (288 digital output channels).

A PDO-Mapping of this object is always made automatically as a default for the first 8 sub-indices. This corresponds to 64 digital output channels.

If more than 64 output channels are present, then the **PDO-Mapping** must be carried out by the user.

Table 67: Object 6200<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Write Output 8 Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	Unsigned8
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	00 <sub>hex</sub>

**6220<sub>hex</sub> Write Output Bit (1...128)**

**6221<sub>hex</sub> Write Output Bit (129...256)**

**6222<sub>hex</sub> Write Output Bit (257...288)**

The objects are a bit-wise representation of the values of the digital output modules. Each Sub-index for these objects is a Boolean value.

A total of 128 bits can be represented (128 digital output channels).

If more than 128 output channels are present, then Object 6221<sub>hex</sub> is used.

If more than 256 output channels are present, then Object 6222<sub>hex</sub> is used.

Since the number of digital input channels in a station is limited to 288, it is not possible to make use of the complete range of the array in Object 6222<sub>hex</sub>.

Table 68: Object 6220<sub>hex</sub>, 6221<sub>hex</sub>, 6222<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Write Output Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	Boolean
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	00 <sub>hex</sub>

## 7 Integration in CANopen

### Objects for writing the process output data

#### **6300<sub>hex</sub> Write Output 16 Bit**

The object presents the values for the digital output modules in 16-bit groups.

A total of 18 groups (each 16-bit) can be defined (288 digital output channels).

Table 69: Object 6300<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Write Output 16 Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...12 <sub>hex</sub>	Unsigned16
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...12 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...12 <sub>hex</sub>	00 <sub>hex</sub>

### 6320<sub>hex</sub> Write Output 32 Bit

The object presents the values for the digital output modules in 32-bit groups.

A total of 9 groups (each 32-bit) can be defined (288 digital output channels).

Table 70: Object 6320<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Write Output Bit
Object Code		ARRAY
PDO Mapping		Yes

	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	Unsigned32
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	00 <sub>hex</sub>

## 7 Integration in CANopen

Objects for the substitute output value in the event of an error

### Objects for the substitute output value in the event of an error

#### Overview

The objects define the substitute value and the substitute-value mode for each individual digital output channel of an XI/ON station. The substitute value is used in the event of a communication error or other unrecoverable error.

These values can not be saved in the digital output modules, since this type of module does not have an EEPROM memory. If the bus-master or the gateway is replaced, the values will have to be updated.

The user can choose between 4 different formats for the substitute-value settings of all the digital output values in the station concerned:

- Only one channel is set up per Sub-index. The substitute-value mode is then set with the Objects 6250<sub>hex</sub>, 6251<sub>hex</sub> and 6252<sub>hex</sub>. The substitute value is set with Objects 6260<sub>hex</sub>, 6261<sub>hex</sub> and 6262<sub>hex</sub>.
- 8 channels are set up per Sub-index. The substitute-value mode is then set with the Object 6206<sub>hex</sub>. The substitute value is set with Object 6207<sub>hex</sub>
- 16 channels are set up per Sub-index. The substitute-value mode is then set with the Object 6306<sub>hex</sub>. The substitute value is set with Object 6307<sub>hex</sub>
- 32 channels are set up per Sub-index. The substitute-value mode is then set with the Object 6326<sub>hex</sub>. The substitute value is set with Object 6327<sub>hex</sub>

The settings are updated regardless of the format (Object) that has been selected.

Table 71: Objects for the substitute value and the substitute-value mode

<b>Index (hex)</b>	<b>Page</b>	<b>Name</b>
6206 <sub>hex</sub>	→ Page 208	Error Mode Output 8 Bit
6207 <sub>hex</sub>	→ Page 209	Error State Output 8 Bit
6250 <sub>hex</sub>	→ Page 210	Error Mode Output Bit (1...128)

6327 <sub>hex</sub>	→ Page 217	Error State Output 32 Bit

## 7 Integration in CANopen

Objects for the substitute output value in the event of an error

### 6206<sub>hex</sub> Error Mode Output 8 Bit

The object defines values in 8-bit groups. A total of 36 groups (each 8-bit) can be defined (288 digital output channels).

It defines (for each digital output channel) whether or not the output should take on a substitute value in the event of an error. The rule is:

- 0     The output maintains its value if an error occurs.
- 1     The output is set to a substitute value if an error occurs.

The substitute values for the digital output channels are defined by the Error State Output Object (6207<sub>hex</sub>).

Table 72: Object 6206<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Error Mode Output 8 Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	Unsigned8
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	FF <sub>hex</sub>

**6207<sub>hex</sub> Error State Output 8 Bit**

The object defines values in 8-bit groups. A total of 36 groups (each 8-bit) can be defined (288 digital output channels).

The substitute value is defined for each digital output channel. The substitute values will only be used in the event of an error if a **1** is entered in an Error Mode Output Object (6206<sub>hex</sub>) for the particular output channel.

Substitute values:

- 0     The output will be switched off if an error occurs.
- 1     The output will be switched on if an error occurs.

Table 73: Object 6207<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Error State Output 8 Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	Unsigned8
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...24 <sub>hex</sub>	00 <sub>hex</sub>

## 7 Integration in CANopen

Objects for the substitute output value in the event of an error

### **6250<sub>hex</sub> Error Mode Output Bit (1...128)**

### **6251<sub>hex</sub> Error Mode Output Bit (129...256)**

### **6252<sub>hex</sub> Error Mode Output Bit (257...288)**

The objects defined the values bit-wise. Each Sub-index for these objects is a Boolean value.

A total of 128 bits can be represented (128 digital output channels).

If more than 128 output channels are present, then Object 6251<sub>hex</sub> is used.

If more than 256 output channels are present, then Object 6252<sub>hex</sub> is used.

Since the number of digital input channels in a station is limited to 288, it is not possible to make use of the complete range of the array in Object 6252<sub>hex</sub>.

It is possible to define, for each digital output channel, whether or not the output should take on a substitute value in the event of an error. The rule is:

- 0      The output maintains its value if an error occurs.
- 1      The output is set to a substitute value if an error occurs.

The substitute values for the digital output channels are defined by the Error State Output Objects (6260<sub>hex</sub>, 6261<sub>hex</sub> und 6262<sub>hex</sub>) definiert.

Table 74: Object 6250<sub>hex</sub>, 6251<sub>hex</sub>, 6252<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Error Mode Output Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	Boolean
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	01 <sub>hex</sub>

## 7 Integration in CANopen

Objects for the substitute output value in the event of an error

### **6260<sub>hex</sub> Error State Output Bit (1...128)**

### **6261<sub>hex</sub> Error State Output Bit (129...256)**

### **6262<sub>hex</sub> Error State Output Bit (257...288)**

The objects defined the values bit-wise. Each Sub-index for these objects is a Boolean value.

A total of 128 bits can be represented (128 digital output channels).

If more than 128 output channels are present, then Object 6261<sub>hex</sub> is used.

If more than 256 output channels are present, then Object 6262<sub>hex</sub> is used.

Since the number of digital input channels in a station is limited to 288, it is not possible to make use of the complete range of the array in Object 6262<sub>hex</sub>.

The substitute value is defined for each digital output channel. The substitute values will only be used in the event of an error if a 1 is entered in an Error Mode Output Object (6250<sub>hex</sub>, 6251<sub>hex</sub> and 6252<sub>hex</sub>) for the particular output channel.

Substitute values:

- 0      The output will be switched off if an error occurs.
- 1      The output will be switched on if an error occurs.

Table 75: Object 6260<sub>hex</sub>, 6261<sub>hex</sub>, 6262<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Error State Output Bit

	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	Boolean
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...80 <sub>hex</sub>	00 <sub>hex</sub>

## 7 Integration in CANopen

Objects for the substitute output value in the event of an error

### 6306<sub>hex</sub> Error Mode Output 16 Bit

The object defines values in 16-bit groups. A total of 18 groups (each 16-bit) can be defined (288 digital output channels).

It is possible to define, for each digital output channel, whether or not the output should take on a substitute value in the event of an error. The rule is:

- 0 The output maintains its value if an error occurs.
- 1 The output is set to a substitute value if an error occurs.

The substitute values for the digital output channels are defined by an Error State Output Object (6307<sub>hex</sub>).

Table 76: Object 6306<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Error Mode Output 16 Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...12 <sub>hex</sub>	Unsigned16
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...12 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...12 <sub>hex</sub>	FFFF <sub>hex</sub>

**6307<sub>hex</sub> Error State Output 16 Bit**

The object defines values in 16-bit groups. A total of 18 groups (each 16-bit) can be defined (288 digital output channels).

The substitute value is defined for each digital output channel. The substitute values will only be used in the event of an error if a 1 is entered in an Error Mode Output Object (6306<sub>hex</sub>) for the particular output channel.

Substitute values:

- 0     The output will be switched off if an error occurs.
- 1     The output will be switched on if an error occurs.

Table 77: Object 6307<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Error State Output 16Bit

	Sub-index 01 <sub>hex</sub> ...12 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...12 <sub>hex</sub>	0000 <sub>hex</sub>

## 7 Integration in CANopen

Objects for the substitute output value in the event of an error

### 6326<sub>hex</sub> Error Mode Output 32 Bit

The object defines values in 32-bit groups. A total of 9 groups (each 32-bit) can be defined (288 digital output channels).

It is possible to define, for each digital output channel, whether or not the output should take on a substitute value in the event of an error. The rule is:

- 0 The output maintains its value if an error occurs.
- 1 The output is set to a substitute value if an error occurs.

The substitute values for the digital output channels are defined by an Error State Output Object (6327<sub>hex</sub>).

Table 78: Object 6326<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Error Mode Output 32 Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	Unsigned32
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	FFFFFFFF <sub>hex</sub>

**6327<sub>hex</sub> Error State Output 32 Bit**

The object defines values in 32-bit groups. A total of 9 groups (each 32-bit) can be defined (288 digital output channels).

The substitute value is defined for each digital output channel. The substitute values will only be used in the event of an error if a 1 is entered in an Error Mode Output Object (6326<sub>hex</sub>) for the particular output channel.

Substitute values:

- 0     The output will be switched off if an error occurs.
- 1     The output will be switched on if an error occurs.

Table 79: Object 6327<sub>hex</sub> description

Feature	Sub-index	Description/Value
Name		Error State Output 32Bit
Object Code		ARRAY
PDO Mapping		Yes
Data type	Sub-index 00 <sub>hex</sub>	Unsigned8
	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	Unsigned32
Access	Sub-index 00 <sub>hex</sub>	ro
	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	rw
Default value, XI/ON	Sub-index 00 <sub>hex</sub>	No
	Sub-index 01 <sub>hex</sub> ...09 <sub>hex</sub>	00000000 <sub>hex</sub>

## 7 Integration in CANopen

### Emergencies

#### Emergencies

The following CANopen Emergencies can be triggered by an XI/ON module of type **Digital Output module**:

Designation	Meaning	Byte 0/1 Error Code	Byte 2 Error Register	Byte 3 Extra info	Byte 4 Additional information
Output current too high	Output current is too high	2310 <sub>hex</sub>	Bit1 (current fault)	Module number	Channel numbers for the 2-channel modules

Bytes 5, 6, 7 of the Emergency frame are unused and are therefore always 0.

## 8 Integration in DeviceNet

### Digital Input Module Class (VSC104)

This class contains all the information and parameters for digital input modules.

Table 80: Class Instance

Attribute no. <b>Dec hex</b>	Attribute name	Access	Type	Description
100 64 <sub>hex</sub>	CLASS REVISION	G	UINT	Contains the revision number of this class (Maj. Rel. × 1000 + Min. Rel.).
101 65 <sub>hex</sub>	MAX INSTANCE	G	USINT	Contains the number of the highest instance of an object created at this level in the class hierarchy.
102 66 <sub>hex</sub>	# OF INSTANCES	G	USINT	Contains the number of object instances created at this class level.
103 67 <sub>hex</sub>	MAX CLASS ATTR	G	USINT	Contains the number of the last class attribute implemented.

## 8 Integration in DeviceNet

### Digital Input Module Class (VSC104)

Table 81: Object Instances

<b>Attribute no.</b>	<b>Attribute name</b>	<b>Access</b>	<b>Type</b>	<b>Description</b>
100 64 <sub>hex</sub>	MAX OBJECT ATTR	G	USINT	Contains the number of the last object attribute implemented.
101 65 <sub>hex</sub>	MODULE PRESENT	G	BOOL	FALSE: XI/ON module is not inserted, vacant base module TRUE: XI/ON module is plugged in
102 66 <sub>hex</sub>	TERMINAL SLOT NUMBER	G	USINT	The slot number of the base module (base module to the right of the gateway = No. 1) belonging to the module. Corresponds to the relevant instance number within the TERMINAL SLOT CLASS.
103 67 <sub>hex</sub>	MODULE ID	G	DWORD	Contains the module ID.
104 68 <sub>hex</sub>	MODULE ORDER NUMBER	G	UDINT	Contains the order no. of the module, e.g. 225000.
105 69 <sub>hex</sub>	MODULE ORDER NAME	G	SHORT_STRING	Contains the module name, e.g. XN-4DI-24VDC-P.
106 6A <sub>hex</sub>	MODULE REVISION	G	USINT	Contains the revision number of the module.

102 66 <sub>hex</sub>	# OF INSTANCES	G	USINT	Contains the number of object instances created at this class level.
103 67 <sub>hex</sub>	MAX CLASS ATTR	G	USINT	Contains the number of the last class attribute implemented.

Table 83: Object Instances

<b>Attribute no.</b>	<b>Attribute name</b>	<b>Access</b>	<b>Type</b>	<b>Description</b>
Dec hex 100 64 <sub>hex</sub>	MAX OBJECT ATTR	G	USINT	Contains the number of the last object attribute implemented.
101 65 <sub>hex</sub>	MODULE PRESENT	G	BOOL	FALSE: XI/ON module is not inserted, vacant base module TRUE: XI/ON module is plugged in
102 66 <sub>hex</sub>	TERMINAL SLOT NUMBER	G	USINT	The slot number of the base module (base module to the right of the gateway = No. 1) belonging to the module. Corresponds to the relevant instance number within the TERMINAL SLOT CLASS.
103 67 <sub>hex</sub>	MODULE ID	G	DWORD	Contains the module ID.
104 68 <sub>hex</sub>	MODULE ORDER NUMBER	G	UDINT	Contains the order no. of the module, e.g. 225000.
105 69 <sub>hex</sub>	MODULE ORDER NAME	G	SHORT_STRING	Contains the module names, e.g. XN-2DO-24VDC-0.5A-P.
106 6A <sub>hex</sub>	MODULE REVISION	G	USINT	Contains the revision number of the module.

### Digital Output Module Class (VSC105)

<b>Attribute no.</b>	<b>Attribute name</b>	<b>Access</b>	<b>Type</b>	<b>Description</b>
107 6B <sub>hex</sub>	MODULE TYPE ID	G	ENUM USINT	<p>Provides information about the module type:</p> <ul style="list-style-type: none"> <li>0 (00<sub>hex</sub>) unknown module type</li> <li>1 (01<sub>hex</sub>) digital I/O-module</li> <li>17 (11<sub>hex</sub>) analog module I/O-voltage</li> <li>18 (12<sub>hex</sub>) analog module I/O-current</li> <li>19 (13<sub>hex</sub>) analog module Pt-temperature</li> <li>20 (14<sub>hex</sub>) analog module thermo-temperature</li> <li>33 (21<sub>hex</sub>) 16-bit counter module</li> <li>34 (22<sub>hex</sub>) 32-bit counter module</li> <li>40 (28<sub>hex</sub>) SSI-module</li> <li>49 (31<sub>hex</sub>) Motor-starter module as direct or reversing starter</li> <li>50 (32<sub>hex</sub>) Electronic motor starter</li> <li>65 (41<sub>hex</sub>) RS232 module</li> <li>66 (42<sub>hex</sub>) RS485/422 module</li> <li>67 (43<sub>hex</sub>) TTY-module</li> </ul>
108 6C <sub>hex</sub>	MODULE COMMAND INTERFACE	G/S	ARRAY	<p>The control interface for the XI/ON module.</p> <p>ARRAY OF: BYTE: control byte sequence</p>
109 6D <sub>hex</sub>	MODULE RESPONSE INTERFACE	G	ARRAY	<p>Message interface for the XI/ON module.</p> <p>ARRAY OF: BYTE: message byte sequence</p>

## 8 Integration in DeviceNet

### Digital Output Module Class (VSC105)

<b>Attribute no.</b>	<b>Attribute name</b>	<b>Access</b>	<b>Type</b>	<b>Description</b>
110 6E <sub>hex</sub>	CONSUMED DATA SIZE	G	UINT	Contains the information about the amount of Consumed Data for the module.
111 6F <sub>hex</sub>	CONSUMED DATA	G/S	DWORD	Contains the output data for the module. DWORD: Bit-wise assignment, depending on the module specification.
112 70 <sub>hex</sub>	DIAG SIZE	G	UINT	Contains the information about the amount of Diagnostics Data for the module.
113 71 <sub>hex</sub>	DIAG	G	DWORD	Contains the diagnostics information for the module. DWORD: Bit-wise assignment, depending on the module specification.
114 72 <sub>hex</sub>	PARAM SIZE	G	UINT	Contains information about the scope of module parameters. The digital XI/ON I/O-modules do not have any settable parameters.
115 73 <sub>hex</sub>	PARAMS	G/S	DWORD	Contains the parameters for the module. DWORD: Bit-wise assignment, depending on the module specification. Since the digital XI/ON I/O-modules have no settable parameters, this attribute is not used.
116 74 <sub>hex</sub>	MODULE REGISTERED INDEX	G	ENUM USINT	Contains the index number found in all module lists.

## **8 Integration in DeviceNet**

### Digital Output Module Class (VSC105)

# Appendix

## Definitions

### Protected outputs according to IEC/EN 61131-2)

For outputs that the manufacturer has specified as **protected**, the following applies:

- The output must be able to withstand the load and/or the corresponding protection device must protect the output for all continuous output currents that exceed 110 % of the rated value;
- After the reset or replacement of the protective device, the PLC system must return to normal operation;
- Additional restart features can be selected from the 3 following types:
  - Protected output with automatic restart: a protected output that automatically restarts operation as soon as the overload is no longer present;
  - Protected output with controlled restart: a protected output that is restarted as a response to specific signals (e.g. by remote control);
  - Protected output with manual restart: a protected output that is restarted by manual action (the protection can be ensured by means of fuses, electronic lock-outs etc.).

**Note:** Lengthy operation in overload conditions may result in a reduction of the operational life of the module.

The protected outputs do not necessarily provide protection for the external wiring. The user is responsible for providing the means necessary to achieve such protection.

**Short-circuit proof outputs (according to  
IEC/EN 61131-2)**

For outputs that the manufacturer has specified as **short-circuit proof**, the following applies:

- For all output currents above the maximum current  $I_{e\ max}$  and up to  $2 \times$  the rated current  $I_e$ , the output must function and withstand a temporary overload. Such temporary overload situations must be defined by the manufacturer.
- The protective device must be activated for all foreseeable output currents greater than  $20 \times$  the rated value. After a rest or replacement of the protective device, the PLC must once more function normally.
- For output currents in the range from  $2\dots 20 \times I_e$  or for temporary overloads above the limits given by the manufacturer (see Item 1 above), a repair or replacement of the module may be required.
- During an overload of  $2 I_e$  for a duration of 5 minutes no danger of fire or electrical shock may result. Directly after every overload the highest temperature increase of the I/O insulation may not exceed the values stated in 4.4.2.
