**Warning!**

Dangerous electrical voltage!

Before commencing the installation

- Disconnect the power supply of the device.
- Ensure that the device cannot be accidentally restarted.
- Verify isolation from the supply.
- Earth and short circuit.
- Cover or enclose neighbouring units that are live.
- Follow the engineering instructions of the device concerned.
- Only suitably qualified personnel in accordance with EN 50110-1/-2 (DIN VDE 0105 Part 100) may work on this device.
- Before installation and before touching the device ensure that you are free of electrostatic charge.
- The functional earth (FE) must be connected to the protective earth (PE) or to the potential equalisation. The system installer is responsible for implementing this connection.
- Connecting cables and signal lines should be installed so that inductive or capacitive interference do not impair the automation functions.
- Install automation devices and related operating elements in such a way that they are well protected against unintentional operation.
- Suitable safety hardware and software measures should be implemented for the I/O interface so that a line or wire breakage on the signal side does not result in undefined states in the automation devices.
- Ensure a reliable electrical isolation of the low voltage for the 24 volt supply. Only use power supply units complying with IEC/HD 60364-4-41 (DIN VDE 0100 Part 410).
- Deviations of the mains voltage from the rated value must not exceed the tolerance limits given in the specifications, otherwise this may cause malfunction and dangerous operation.
- Emergency stop devices complying with IEC/EN 60204-1 must be effective in all operating modes of the automation devices. Unlatching the emergency-stop devices must not cause uncontrolled operation or restart.
- Measures should be taken to ensure the proper restart of programs interrupted after a voltage dip or failure. This should not cause dangerous operating states even for a short time. If necessary, emergency-stop devices should be implemented.
- Wherever faults in the automation system may cause damage to persons or property, external measures must be implemented to ensure a safe operating state in the event of a fault or malfunction (for example, by means of separate limit switches, mechanical interlocks etc.).

Safety regulations

- The electrical installation must be carried out in accordance with the relevant regulations (e.g. with regard to cable cross sections, fuses, PE).
- All work relating to transport, installation, commissioning and maintenance must only be carried out by qualified personnel. (IEC/HD 60364 (DIN VDE 0100) and national work safety regulations).

About This Manual

Writing conventions

Symbols used in this manual have the following meanings:

**Note!**

Warns of a hazardous situation that could result in slight damage to the product or components.

**Caution!**

Warns of the possibility of a hazardous situation that could result in major damage and minor injury.

**Warning!**

Warns of the possibility of a hazardous situation that could result in major damage and serious or fatal injury or even death.

Indicates interesting tips and additional information.

About This Manual
Writing conventions

1 Product Description

General product description

The XN-1SSI technology module is an addition to the XI/ON range of components in slice design. It is used for connecting SSI encoders with a maximum word length of 32 bits and a maximum bit transmission rate of 1Mbit/s. The module provides a 24 V DC (500 mA) power supply. In order to read SSI encoder data, the XN-1SSI module outputs a clock signal with which the encoder value can be read via the signal input. The clock signal and the signal input are based on the RS422 protocol.

The module can be fitted or removed during operation without damaging the module electronics. Once the module is removed or fitted, this is detected with the next telegram, the module list is updated and communication with all modules of the station is restored. Communication is maintained for as long as no more than two adjacent modules have been removed. Removing the electronics module will cause the power supply of the SSI encoder to be disconnected from the field voltage.

Power supply

The connected SSI encoder is fed with power via the output terminals of the SSI module. The power supplied to the XN-PF-24VDC-D power feeding module and XN-BR-24VDC-D bus refreshing module is distributed via the bus system and connected directly to the output terminals. The module bus electronics unit is fed by the module bus.

Transmission procedure

The XN-1SSI module enables the SSI data to be transferred according to the requirements of the application. The parameters of the XN-1SSI module can be configured by the user to set up a functional transmission procedure as required.

Gray code or binary code data transmission is possible.

Bit transmission rates from 62.5 Kbit/s to 1 Mbit/s are possible.

The SSI encoder value can be represented in a data frame with between 1 to 32 bits. Bits can be deactivated at both the LSB and MSB side of the frame. At the MSB side this is done by a masking operation, which causes invalid bits to be set to 0. At the LSB side, the invalid bits are removed by shifting the entire data frame to the right. The missing bits on the MSB side are filled with zeros.

Data exchange

The process output data is transmitted from the PLC to the XN-1SSI module, whilst the process input data is transferred from the XN-1SSI module to the PLC.

The process output data is used for writing the registers and requesting data from them. It is possible to stop the communication with the SSI encoder and activate or deactivate comparison operations.

The process input data is used for reading the contents of the registers inside the modules. In this case, the SSI encoder value is part of the register. The writing of these registers can be controlled. The results of different comparison operations can be supplied, and the communication status with the SSI encoder can also be

displayed. Status messages that were generated by the connected SSI encoder can be passed to the PLC as process input data.

The diagnostics messages are also embedded in the process input data.

The parameter and diagnostics interface allows acyclic data to be transferred in addition to this cyclic data. The parameters for the data transmission on the SSI module, such as bit transmission rate, telegram length etc. are set via the parameter interface. The diagnostics interface supplies the higher-level system with error messages, such as parameter errors.

Internal registers - read and write operations

The SSI module is provided with a universal register interface that enables access to up to 64 registers. These are accessed via the process data.

For write access, it must be ensured beforehand that the register write interface is in the default status and that a write access operation is therefore not currently active. This is ensured if $REG_WR = 0$ in the process output data, and is confirmed in the process input data with $REG_WR_AKN = 0$. Write access is then possible. The following values must be transferred with the process output data for this:

REG_WR_ADR = Register address,
 REG_WR_DATA = Value to be written (32 bit)
 $REG_WR = 1$ (write command)

The SSI module acknowledges the processing of the write command via the process input data by signalling $REG_WR_AKN = 1$.

$REG_WR_ACCEPT = 1$ in the process input data confirms whether the write operation to the

1 Product Description

General product description

register was successfully completed. If the register could not be written (no access authorisation, out of value range, ...), this is indicated by $REG_WR_ACCEPT = 0$. The write operation must then be terminated by $REG_WR = 0$ in order to resume the default state.

The address specified at REG_RD_ADR of the process output data is used for read access. The read register content is entered in REG_RD_DATA (bytes 4-7) if the address at REG_RD_ADR was accepted in the process input data and if $REG_RD_ABORT = 0$ confirms that the register was read error-free. $REG_RD_ABORT = 1$ indicates that the register could not be read. REG_RD_ADR in the process input data then contains the address that could not be accessed successfully. The user data is then set to ZERO.

Register access and meaning

Designation		Description	Default (HEX)

REG	63
-----	----

Retentive registers can be written up to 100,000 times.

Comparison value 1, Comparison value 2

The recorded encoder position can be compared with two loadable values. The character "x" below stands for "1" or "2". The register contents are loaded into the register REG_CMPx using in a write operation. The comparison functions are activated by setting bit EN_CMPx = 1 in the process output data. The results of the continuous comparison operations are displayed in the process input data via STS_CMPx, REL_CMPx and FLAG_CMPx. Bit REL_CMPx indicates as the actual status message the relation of the actual value (register content of REG_SSI_POS) to the comparison value (register content of REG_CMPx). Bit STS_CMPx is non-retentive and indicates whether the current actual value (REG_SSI_POS) and the comparison value (REG_CMPx) match. FLAG_CMPx is also used as a marker to indicate that the status (REG_SSI_POS = REG_CMPx) is present or lost. This bit must be reset by the application via the process output data using CLR_CMPx = 1. If the comparator is inactive (EN_CMPx = 0), the signals from STS_CMPx, REL_CMPx and FLAG_CMPx are always zero.

1 Product Description

General product description

Comparator enable	Process input data		Process output data
EN_CMPx = 0	REL_CMPx = 0 STS_CMPx = 0 FLAG_CMPx = 0		
EN_CMPx = 1	(REG_SSI_POS) < (REG_CMPx)	REL_CMPx = 0 STS_CMPx = 0 FLAG_CMPx = Z ₀ *	Reset the FLAG_CMPx flag with CLR_CMPx = 1
	(REG_SSI_POS) > (REG_CMPx)	REL_CMPx = 1 STS_CMPx = 0 FLAG_CMPx = Z ₀ *	Reset the FLAG_CMPx flag with CLR_CMPx = 1
	(REG_SSI_POS) = (REG_CMPx)	REL_CMPx = 1 STS_CMPx = 1 FLAG_CMPx = 1	Reset of FLAG_CMPx not possible when values match

*The value Z₀ of this flag is 1 as soon as the comparison values match. The value stays 1 until it is reset.

Lower limit, upper limit

The recorded encoder position can be compared with up to two loadable limit values. The upper limit value must be entered in the REG_UPPER_LIMIT register and the lower limit value in REG_LOWER_LIMIT. Writing these registers with values that are different to the default values will activate the monitoring of the limits, and bits STS_OFLW and STS_UFLW will be enabled in the process input data. The diagnostics function will indicate the presence of values above or below the default values.

“Encoder value overflow” and “Encoder value underflow” signals will also indicate this via the acyclic diagnostics interface.

The limit values are set by default to the maximum and minimum value.

1 Product Description

General product description

Table 1: Overflow of the encoder values

Register access	Process input data		Diagnostics
REG_UPPER_LIMIT at default value FFFFFFFF _{hex}	STS_OFLW = 0		Value: 0
Register content of REG_UPPER_LIMIT less than FFFFFFFF _{hex}	(REG_SSI_POS) <= (REG_UPPER_LIMIT)	STS_OFLW = 0	Value: 0
	(REG_SSI_POS) > (REG_UPPER_LIMIT)	STS_OFLW = 1	Value: 1 Text: Encoder value overflow

Table 2: Underflow of the encoder values

Register access	Process input data		Diagnostics
REG_LOWER_LIMIT at default value 00000000 _{hex}	STS_UFLW = 0		Value: 0
Register content of REG_LOWER_LIMIT greater than 0	(REG_SSI_POS) >= (REG_LOWER_LIMIT)	STS_UFLW = 0	Value: 0
	(REG_SSI_POS) < (REG_LOWER_LIMIT)	STS_UFLW = 1	Value: 1 Text: Encoder value underflow

Offset function / load value

This function is activated by writing the REG_OFFSET register with a value $\neq 0$. The content of the register is then subtracted from the SSI encoder value and stored in REG_SSI_POS. All limit values, such as lower limit, upper limit, comparison value 1, comparison value 2 then refer to the newly calculated value (REG_SSI_POS).

The calculation is thus:

$$(\text{REG_SSI_POS}) = \text{SSI encoder} - (\text{REG_OFFSET})$$

This function can be deactivated by writing the REG_OFFSET with zero.

Status messages of the SSI encoder

Some SSI encoders not only transfer the position value in the data frame that they transfer to the module but also supply additional status messages. It is useful to include these status messages in the application in order to analyse the measured value.

Writing the REG_SSI_MASK register allows up to four individual bits to be taken from the data frame of the SSI encoder and transferred to the SSI_STSx bits of the process input data. It is also possible to output the "SSI encoder group diagnostics message" with an acyclic diagnostics operation when a status message is initiated.

1 Product Description

General product description

Table 3: Masking with REG_SSI_MASK

Process input data		REG_SSI_MASK							
Byte	B7	B6	B5	B4	B3	B2	B1	B0	
SSI_STS0	0	EN_D0_RMS0	EN_D0_DS	X	SSI_FRAME_BIT_SEL0				
SSI_STS1	1	EN_D1_RMS1	EN_D1_DS	X	SSI_FRAME_BIT_SEL1				
SSI_STS2	2	EN_D2_RMS2	EN_D2_DS	X	SSI_FRAME_BIT_SEL2				
SSI_STS3	3	EN_D3_RMS3	EN_D3_DS	X	SSI_FRAME_BIT_SEL3				

Designation	Value	Description
EN_Dx_RMSx	0 ¹⁾	The transfer of the SSI status messages to the process input data is not activated
	1	The transfer of the SSI status messages to the process input data is activated
EN_Dx_DS	0 ¹⁾	The evaluation of the SSI status messages for bit 0 of the diagnostics is not activated
	1	The evaluation of the SSI status messages for bit 0 of the diagnostics is activated.
SSI_FRAME_BIT_SEL	0-31	Definition of the selected bits in the frame of the SSI encoder to be evaluated or copied. Default:0

1) Default

The following applies to bit 0 (SSI group diagnostics) of the diagnostics interface and SSI_DIAG of the process input data:

$$(SSI_STS0 \& EN_D0_DS) \parallel (SSI_STS1 \& EN_D1_DS) \parallel (SSI_STS2 \& EN_D2_DS) \parallel (SSI_STS3 \& EN_D3_DS)$$

Resetting the register bank

If register REG_SF is written with the signature:

“LD20” = 6C643230_{hex},

all default values of the retentive registers (incl. parameter registers) are reset.

If register REG_SF is written with the signature:

“LD48” = 6C643438_{hex}

all default values of the retentive registers except the parameter registers are reset.

Overwritten values are lost.

Technical features

Block diagram of the XN-1SSI

Figure 1: XN-1SSI electronics module

Figure 2: XN-1SSI block diagram

Technical data of the XN-1SSI

The module is provided with two RS422 interfaces that form one SSI interface. One RS422 interface works as the clock generator for reading the data, which is then received on the other RS422 interface.

2 Integrating the Module in PROFIBUS-DP

PROFIBUS-DP data image

Process input

The field input data is transferred from the connected field device to the XN-1SSI module.

The process input data is the data that is transferred to the PLC from the XN-1SS1 via a gateway.

This is transferred in an 8 byte format as follows:

- 4 bytes are used for representing the data that was read from the register with the address stated at REG_RD_ADR.
- When necessary, 1 byte represents the register address of the read data and an acknowledgement that the read operation was successful.
- 1 byte can be used to transfer status messages of the SSI encoder. This byte also contains an acknowledgement that the write operation to the register was successful and indication of an active write operation.
- 1 byte contains the results of comparison operations with the SSI encoder value.
- 1 byte contains messages concerning the communication status between the XN-1SSI module and the SSI encoder, as well as other results of comparison operations.

2 Integrating the Module in PROFIBUS-DP

PROFIBUS-DP data image

The following table describes the structure of the 8 x 8 bits of the process input data.

STS (or ERR) contains non-retentive status information, i.e. the bit concerned indicates the actual status.

FLAG describes a retentive flag that is set in the event of a particular event. The bit concerned retains the value until it is reset.

Structure of the data bytes in the PROFIBUS-DP fieldbus:

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Byte 0	REG_RD_DATA, Byte 3							
...	...							
Byte 3	REG_RD_DATA, Byte 0							
Byte 4	REG_RD_ABORT	X	REG_RD_ADR (MSB to LSB)					
Byte 5	REG_WR_ACCEPT	REG_WR_AKN	X	X	SSI_STS3	SSI_STS2	SSI_STS1	SSI_STS0
Byte 6	STS_UP	STS_DN	REL_CMP2	FLAG_CMP2	STS_CMP2	REL_CMP1	FLAG_CMP1	STS_CMP1
Byte 7	STS_STOP	X	X	ERR_PARA	STS_UFLW	STS_OFLW	ERR_SSI	SSI_DIAG

X = reserved

Meaning of the data bits (process input data):

Designation	Value	Description
REG_RD_DATA	0... 2 ³²⁻¹	Content of the register to be read if REG_RD_ABORT = 0. If REG_RD_ABORT = 1, REG_RD_DATA = 0.
REG_RD_ABORT	0	The reading of the register stated at REG_RD_ADR was accepted and executed. The content of the register is located in the user data range (REG_RD_DATA Bytes 0-3).
	1	The reading of the register stated at REG_RD_ADR was not accepted. The user data range (REG_RD_DATA Bytes 0-3) is zero.
REG_RD_ADR	0...63	Address of the register containing the data shown in the user data range (REG_RD_DATA Bytes 0-3) of the process input data when REG_RD_ABORT = 0.
REG_WR_ACCEPT	0	The writing of user data for process output to the register with the address stated at REG_WR_ADR in the process output data could not be executed.
	1	The writing of user process output data to the register with the address stated at REG_WR_ADR in the process output data was successfully completed.
REG_WR_AKN	0	No modification of the data in the register bank by process output, i.e. REG_WR = 0 → Chapter "Process output". A write job would be accepted with the next telegram of process output data. (handshake for data transmission to the register.)
	1	A modification of the register contents by a process output was initiated, i.e. REG_WR = 1 → Chapter "Process output". A write job would not be accepted with the next telegram of process output data.

2 Integrating the Module in PROFIBUS-DP

PROFIBUS-DP data image

Designation	Value	Description	
SSI_STS3	0	These four bits transfer the status bits of the SSI encoder with the status messages of the SSI module. With some SSI encoders, the status bits are transferred together with the position value.	
	1		
SSI_STS2	0		
	1		
SSI_STS1	0		
	1		
SSI_STS0	0		
	1		
STS_UP (LED UP)	0		The SSI encoder values are decremented or the values are constant.
	1		The SSI encoder values are incremented.
STS_DN (LED DN)	0	The SSI encoder values are incremented or the values are constant.	
	1	The SSI encoder values are decremented.	
REL_CMP2	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_CMP2)	
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) ≥ (REG_CMP2)	
FLAG_CMP2	0	Default status, i.e. the register contents have not yet matched (REG_SSI_POS) = (REG_CMP2) since the last reset.	
	1	The contents of the registers match (REG_SSI_POS) = (REG_CMP2). This marker must be reset with CLR_CMP2 = 1 in the process output data.	
STS_CMP2	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_CMP2)	
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) = (REG_CMP2)	

2 Integrating the Module in PROFIBUS-DP

PROFIBUS-DP data image

Designation	Value	Description
REL_CMP1	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_CMP1)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) ≥ (REG_CMP1)
FLAG_CMP1	0	Default status, i.e. the register contents have not yet matched (REG_SSI_POS) = (REG_CMP1) since the last reset.
	1	The contents of the registers match: (REG_SSI_POS) = (REG_CMP1). This marker must be reset when CLR_CMP1 = 1 in the process output data.
STS_CMP1	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_CMP1)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) = (REG_CMP1)
STS_STOP	0	The SSI encoder is read cyclically.
	1	Communication with the SSI encoder is stopped as STOP = 1 (process output) or ERR_PARA = 1.
ERR_PARA	0	The parameter set of the module has been accepted.
	1	Operation of the module is not possible with the present parameter set.
STS_UFLW	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) ≥ (REG_LOWER_LIMIT)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_LOWER_LIMIT)

2 Integrating the Module in PROFIBUS-DP

PROFIBUS-DP data image

Designation	Value	Description
STS_OFLW	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) \leq (REG_UPPER_LIMIT)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) > (REG_UPPER_LIMIT)
ERR_SSI	0	SSI encoder signal present.
	1	SSI encoder signal faulty. (e.g. due to a cable break).
SSI_DIAG	0	No enabled status signal is active (SSI_STSx = 0).
	1	At least one enabled status signal is active (SSI_STSx = 1).

Process output

The field output data is transferred from the XN-1SSI module to the connected field device.

The process output data is the data that is output from the PLC to the XN-1SSI module via a gateway.

This is transferred in an 8 byte format as follows:

- 4 bytes are used for representing the data that is to be written to the register with the address specified at REG_WR_DATA.
- 1 byte contains the register address for the data that is to be read with the next response telegram.
- 1 byte contains the register address of the data to be written to bytes 0 to 3 of this telegram and a write request.
- 1 byte is used for controlling the comparison operations.
- 1 byte contains a Stop bit for interrupting communication with the encoder.

Structure of the data bytes (process output data):

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Byte 0	REG_WR_DATA, Byte 3							
...	...							
Byte 3	REG_WR_DATA, Byte 0							
Byte 4	X	X	REG_RD_ADR					
Byte 5	REG_WR	X	REG_WR_ADR					
Byte 6	X	X	X	CLR_CMP2	EN_CMP2	X	CLR_CMP1	EN_CMP1
Byte 7	STOP	X	X	X	X	X	X	X

X = reserved

Meaning of the data bits (process output data):

Designation	Value	Description
REG_WR_DATA	0... $2^{32}-1$	Value to be written to the register with the address stated at REG_WR_ADR.
REG_RD_ADR	0...63	Address of the register to be read. If the read operation is successful (REG_RD_ABORT = 0), the user data is located in REG_RD_DATA of the process input data (bytes 4 – 7).
REG_WR	0	Default status, i.e. there is no request to overwrite the content of the register with the address stated at REG_WR_ADR with REG_WR_DATA. Bit REG_WR_AKN (→ Chapter “Process input”) is reset (0) if necessary.
	1	Request to overwrite the content of the register with the address stated at REG_WR_ADR with REG_WR_DATA.
REG_WR_ADR	0...63	Address of the register to be written with REG_WR_DATA.
CLR_CMP2	0	Default status, i.e. no reset of FLAG_CMP2 active.
	1	Reset of FLAG_CMP2 active

2 Integrating the Module in PROFIBUS-DP

PROFIBUS-DP data image

Designation	Value	Description
EN_CMP2	0	Default status, i.e. the data bits REL_CMP2, STS_CMP2 and FLAG_CMP2 always have the value 0, irrespective of the actual SSI encoder value.
	1	Comparison active, i.e. the data bits REL_CMP2, STS_CMP2 and FLAG_CMP2 have a value based on the result of the comparison with the SSI encoder value.
CLR_CMP1	0	Default status, i.e. reset of FLAG_CMP1 not active.
	1	Reset of FLAG_CMP1 active
EN_CMP1	0	Default status, i.e. the data bits REL_CMP1, STS_CMP1 and FLAG_CMP1 always have the value 0, irrespective of the actual SSI encoder value.
	1	Comparison active, i.e. the data bits REL_CMP1, STS_CMP1 and FLAG_CMP1 have a value based on the result of the comparison with the SSI encoder value.
STOP	0	Request to read the SSI encoder cyclically
	1	Request to interrupt communication with the encoder

Diagnostics

The parameter setting for the PROFIBUS-DP gateway provides the Gateway Diagnostics parameter for selecting between two different diagnostics displays. Choose "Devices, ID, Channel Diagnostics" to select more detailed diagnostics indication. The diagnostics message will then consist of the following elements:

- 2 bytes of gateway diagnostics (device-related diagnostics)
- 64 bits of ID-specific diagnostics
- $n \times 3$ bytes of channel-specific diagnostics (n : number of channels with active diagnostics)

With channel-specific diagnostics the use of an error number enables the type of error to be indicated as text (e.g. Parameter error).

When "Device-related Diagnostics" is selected, an abbreviated diagnostics message is generated that simply shows the gateway diagnostics (device-related diagnostics). The diagnostics bytes of all station modules are attached that support diagnostics.

Meaning of the data bits (diagnostics):

Name of error type	Position (Type 2)	Value	Description
SSI group diagnostics	Bit 0	0	No enabled status signal active: SSI_STSx = 0 or no status messages of the SSI encoder present.
		1	At least one enabled status signal is active: SSI_STSx = 1.
Wire-break	Bit 1	0	SSI encoder signal present.
		1	SSI encoder signal faulty (e.g. due to a cable break).
Encoder values overflow	Bit 2	0	SSI encoder value below / equal to upper limit.
		1	SSI encoder value above upper limit. Overflow occurred.
Encoder values underflow	Bit 3	0	SSI encoder value above / equal to lower limit.
		1	SSI encoder value below lower limit. Underflow occurred.
Parameter error	Bit 4	0	The parameter set of the module has been accepted.
		1	Operation of the module is not possible with the present parameter set.

Parameters

Parameters consist of data that has to be sent to the module so that it can operate correctly in the application concerned.

Meaning of the data bits (parameters):

Designation	Value	Name of the values	Description
Encoder data cable test	0 ¹⁾	Activate	ZERO test of data cable.
	1	Deactivate	After the last valid bit, a ZERO test of the data cable is not carried out.
Number of invalid bits (LSB)	0 to 15	0 to 15	Number of invalid bits on the LSB side of the position value supplied by the SSI encoder. The meaningful word width of the position value transferred to the module bus master is as follows: ²⁾ SSI_FRAME_LEN - INVALID_BITS_MSB - INVALID_BITS_LSB. The invalid bits on the LSB side are removed by shifting the position value to the right, starting with the LSB. (Default 0 Bit = 0x 0). INVALID_BITS_MSB + INVALID_BITS_LSB must always be less than SSI_FRAME_LEN.

2 Integrating the Module in PROFIBUS-DP

PROFIBUS-DP data image

Designation	Value	Name of the values	Description
Number of invalid bits (MSB)	0 to 7	0 to 7	Number of invalid bits on the MSB side of the position value supplied by the SSI encoder. The meaningful word width of the position value transferred to the module bus master is as follows: ²⁾ SSI_FRAME_LEN - INVALID_BITS_MSB - INVALID_BITS_LSB. The invalid bits on the MSB side are zeroed by masking the position value. INVALID_BITS_MSB + INVALID_BITS_LSB must always be less than SSI_FRAME_LEN. Default: 0 = 0 _{hex}
Bit transmission rate	0	1000000 Bit/s	
	1 ¹⁾	500000 Bit/s	
	2	250000 Bit/s	
	3	125000 Bit/s	
	4	100000 Bit/s	
	5	83000 Bit/s	
	6	71000 Bit/s	
	7	62500 Bit/s	
	8 to 15		Reserve
Number of data frame bits	1 to 32	1 to 32	Number of bits of the SSI data frame. ²⁾ SSI_FRAME_LEN must always be greater than INVALID_BITS. Default: 25 = 19 _{hex}

2 Integrating the Module in PROFIBUS-DP

PROFIBUS-DP data image

Designation	Value	Name of the values	Description
Data format	0 ¹⁾	Binary coded	SSI encoder sends data in binary code
	1	GRAY-coded	SSI encoder sends data in Gray code

- 1) Default
- 2) SSI_FRAME_LEN: Number of data frame bits
INVALID_BITS_MSB: Number of invalid bits (MSB)
INVALID_BITS_LSB: Number of invalid bits (LSB)
INVALID_BITS: INVALID_BITS_MSB +
INVALID_BITS_LSB

Error detection / messages

The following errors and diagnostics are reported by the module:

Diagnostics	Process input data	Description
SSI group diagnostics	SSI_DIAG	At least one enabled status message is active.
Wire-break	ERR_SSI	Non-retentive error message. Error detected in the interface (e.g. wire-break).
Encoder values overflow	STS_OFLW	Non-retentive error message. Upper limit exceeded (overflow).
Encoder values underflow	STS_UFLW	Non-retentive error message. Gone below lower limit.
Parameter error	ERR_PARA	Non-retentive error message, and rejected parameter set with it.
	STS_STOP	Non-retentive status message indicating Stop / Go operating mode of the SSI module.
	STS_CMP1	Non-retentive status message indicating the relationship (k or =) of the SSI encoder value to the comparison value 1.
	FLAG_CMP1	Retentive marker for SSI encoder value = Comparison value 1.
	REL_CMP1	Non-retentive status message indicating the relationship (f or <) of the SSI encoder value to the comparison value 1.
	STS_CMP2	Non-retentive status message indicating the relationship (k or =) of the SSI encoder value to the comparison value 2.
	FLAG_CMP2	Retentive marker for SSI encoder value = Comparison value 2.

2 Integrating the Module in PROFIBUS-DP

PROFIBUS-DP data image

Diagnostics	Process input data	Description
	REL_CMP2	Non-retentive status message indicating the relationship (f or <) of the SSI encoder value to the comparison value 2.
	STS_DN	Non-retentive status message indicating the direction of the SSI encoder.
	STS_UP	Non-retentive status message indicating the direction of the SSI encoder.

Function block for SIMATIC S7

The function block that was created for the SIMATIC S7 PLC system (Siemens) enables the data bytes to be exchanged between the PLC and the XN-1SSI module, and provides in particular access to the register interface.

The system function blocks SFC14 and SFC15 from Siemens are used in order to ensure consistent data exchange. The return values are transferred transparently, and the meaning of the error numbers can be obtained from the manual "System software for S7-300/400".

Function block for SIMATIC S7

Figure 5: Function block for data exchange with the SIMATIC S7 software

2 Integrating the Module in PROFIBUS-DP

Function block for SIMATIC S7

Table 8: Input variables of FB_SSI

Variable	Meaning
SSI_INPUT	<p>Start address for the 8-byte input address range of the XN-1SSI module.</p> <p>The SIMATIC STEP 7 software assigns the address ranges to the appropriate modules. The address ranges are selected and displayed in the hardware configurator of the software.</p> <p>WORD format is used for the addresses and therefore consists of 2 bytes.</p> <p>Example: The decimal value 258 must be transferred in hexadecimal code as W#16#102.</p>
SSI_OUTPUT	<p>Start address for the 8-byte output address range of the XN-1SSI module.</p> <p>The SIMATIC STEP 7 software assigns the address ranges to the appropriate modules. The address ranges are selected and displayed in the hardware configurator of the software.</p> <p>WORD format is used for the addresses and therefore consists of 2 bytes.</p> <p>Example: The decimal value 258 must be transferred in hexadecimal code as W#16#102.</p>
STOP	<p>0: Request to read the SSI encoder cyclically</p> <p>1: Request to interrupt communication with the encoder.</p>
EN_CMP1	<p>0: Default status, i.e. the data bits REL_CMP1, STS_CMP1 and FLAG_CMP1 always have the value 0, irrespective of the actual SSI encoder value.</p> <p>1: Comparison active, i.e. the data bits REL_CMP1, STS_CMP1 and FLAG_CMP1 have a value based on the result of the comparison with the SSI encoder value.</p>
CLR_CMP1	<p>0: Default status, i.e. reset of FLAG_CMP1 not active.</p> <p>1: Reset of FLAG_CMP1 active.</p>

2 Integrating the Module in PROFIBUS-DP

Function block for SIMATIC S7

Variable	Meaning
EN_CMP2	0: Default status, i.e. the data bits REL_CMP2, STS_CMP2 and FLAG_CMP2 always have the value 0, irrespective of the actual SSI encoder value. 1: Comparison active, i.e. the data bits REL_CMP2, STS_CMP2 and FLAG_CMP2 have a value based on the result of the comparison with the SSI encoder value.
CLR_CMP2	0: Default status, i.e. reset of FLAG_CMP2 not active. 1: Reset of FLAG_CMP2 active.
REG_WR	0: Default status, i.e. there is no request to overwrite the content of the register with the address stated at REG_WR_ADR with REG_WR_DATA. Bit REG_WR_AKN (output variable) is reset from 1 to 0 if necessary. 1: Request to overwrite the content of the register with the address stated at REG_WR_ADR with REG_WR_DATA.
REG_RD_ADR	Address of the register to be read.
REG_WR_ADR	Address of the register to be written with REG_WR_DATA.
REG_WR_DATA	Value to be written to the register with the address stated at REG_WR_ADR.

2 Integrating the Module in PROFIBUS-DP

Function block for SIMATIC S7

Table 9: Output variables of FB_SSI

Variable	Meaning
REG_RD_DATA	Read data at the register with the address stated at REG_RD_ADR if access is successful (REG_RD_ABORT = 0).
REG_RD_ADR_STAT	Return the register address for the read data REG_RD_DATA.
REG_RD_ABORT	1: Reading of register with the address stated at REG_RD_ADR could not be executed successfully. The operation was aborted. 0: Reading of register with the address stated at REG_RD_ADR was executed successfully. The read data is shown at REG_RD_DATA.
REG_WR_AKN	1: Writing of the register was requested with REG_WR = 1 in the previous cycle. Another write request with REG_WR = 1 is not accepted. This value returns to 0 when REG_WR = 0. 0: A write request with REG_WR = 1 is accepted. This value then changes to 1. A further write request is ignored.
REG_WR_ACCEPT	1: Writing of register with the address stated at REG_WR_ADR was executed successfully. 0: Writing of register with the address stated at REG_WR_ADR was not executed successfully.
STS_CMP1	0: A comparison of the register contents has produced the following result: (REG_SSI_POS) \neq (REG_CMP1) 1: A comparison of the register contents has produced the following result: (REG_SSI_POS) = (REG_CMP1)
FLAG_CMP1	0: Default status, i.e. the register contents have not yet matched (REG_SSI_POS) = (REG_CMP1) since the last reset. 1: The contents of the registers match: (REG_SSI_POS) = (REG_CMP1). This marker must be reset with bit CLR_CMP1 = 1.

2 Integrating the Module in PROFIBUS-DP

Function block for SIMATIC S7

Variable	Meaning
REL_CMP1	0: A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_CMP1) 1: A comparison of the register contents has produced the following result: (REG_SSI_POS) \geq (REG_CMP1)
STS_CMP2	0: A comparison of the register contents has produced the following result: (REG_SSI_POS) k (REG_CMP2) 1: A comparison of the register contents has produced the following result: (REG_SSI_POS) = (REG_CMP2)
FLAG_CMP2	0: Default status, i.e. the register contents have not yet matched (REG_SSI_POS) = (REG_CMP2) since the last reset. 1: The contents of the registers match: (REG_SSI_POS) = (REG_CMP2). This marker must be reset with bit CLR_CMP2 = 1.
REL_CMP2	0: A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_CMP2) 1: A comparison of the register contents has produced the following result: (REG_SSI_POS) \geq (REG_CMP2)
STS_DN	0: The SSI encoder values are incremented or the SSI encoder values are constant. 1: The SSI encoder values are decremented.
STS_UP	0: The SSI encoder values are decremented or the SSI encoder values are constant. If STS_DN = 0 at the same time, this means that the SSI encoder has stopped. 1: The SSI encoder values are incremented.
STS_OFLOW	0: A comparison of the register contents has produced the following result: (REG_SSI_POS) \leq (REG_UPPER_LIMIT) 1: A comparison of the register contents has produced the following result: (REG_SSI_POS) > (REG_UPPER_LIMIT)

2 Integrating the Module in PROFIBUS-DP

Function block for SIMATIC S7

Variable	Meaning
STS_UFLW	0: A comparison of the register contents has produced the following result: (REG_SSI_POS) \geq (REG_LOWER_LIMIT) 1: A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_LOWER_LIMIT)
STS_STOP	0: The SSI encoder is read cyclically. 1: Communication with the SSI encoder is stopped as STOP = 1.
SSI_DIAG	0: No enabled status signal active: SSI_STSx = 0 or no status messages of the SSI encoder present. 1: At least one enabled status signal is active: SSI_STSx = 1
SSI_STS0	These four bits transfer the status bits of the SSI encoder with the status messages of the SSI module. With some SSI encoders, the status bits are transferred together with the position value.
SSI_STS1	
SSI_STS2	
SSI_STS3	
ERR_SSI	0: SSI encoder signal present. 1: SSI encoder signal faulty. (e.g. due to a cable break).
ERR_PARA	0: The parameter set of the module has been accepted. 1: Operation of the module is not possible with the present parameter set.
RETVAl	Return value of the function (status or error code) 0: Everything OK. No error 8xxxh:Error Formal operands
RETVALSFC14	See manual "System software for S7-300/400, SFC14"
RETVALSFC15	See manual "System software for S7-300/400, SFC15"

Process image

The structure of the process image is represented with symbolic names. These correspond to the attribute names which also correspond to the relevant functions.

The bits and bit groups assigned to the names indicate numerical values.

The meaning of the numerical values is explained in the description of the attributes.

Table 10: Process input

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

SSI Module Class (VSC116) This class contains all the parameters and information relating to the XN-1SSI module.

Table 13: Class Instance

Attr. no. dec. (hex.)	Attribute name	Access	Type	Description
100 (64h)	CLASS REVISION	G	UINT	Contains the revision number of this class (Maj. Rel. x 1000 + Min. Rel.).
101 (65h)	MAX INSTANCE	G	USINT	Contains the number of the highest instance of an object created on this level in the class hierarchy.
102 (66h)	# OF INSTANCES	G	USINT	Contains the number of object instances created on this class level.
103 (67h)	MAX CLASS ATTR	G	USINT	Contains the number of the last class attribute implemented.

3 Integrating the Module in DeviceNet

SSI Module Class (VSC116)

Table 14: Object instances

Attr. no. dec. (hex.)	Attribute name	Access	Type	Description
100 (64 _{hex})	MAX OBJECT ATTRIBUTE	G	USINT	Contains the number of the last object attribute implemented.
101 (65 _{hex})	MODULE PRESENT	G	BOOL	0: XI/ON module is not plugged in, empty base module. 1: XI/ON module is plugged in
102 (66 _{hex})	TERMINAL SLOT NUMBER	G	USINT	The slot number of the base module (base module to the right of the gateway = No. 1) belonging to the module. Corresponds to the instance number within the TERMINAL SLOT CLASS.
103 (67 _{hex})	MODULE ID	G	DWORD	Contains the module ID.
104 (68 _{hex})	MODULE ORDER NUMBER	G	UDINT	Contains the order number of the module.
105 (69 _{hex})	MODULE ORDER NAME	G	SHORT_STRING	Contains the module name, e.g. XN-1RS485/422.
106 (6A _{hex})	MODULE REVISION NUMBER	G	USINT	Contains the revision number of the module firmware.

130 (82 _{hex})	INVALID BITS MSB	G/S	USINT	Number of invalid bits on the MSB side of the position value supplied by the SSI encoder. The meaningful word width of the position value transferred to the module bus master is as follows: FRAME LENGTH - INVALID BITS MSB - INVALID BITS LSB. The invalid bits on the MSB side are zeroed by masking the position value. INVALID BITS MSB + INVALID BITS LSB must always be less than FRAME LENGTH. Default: 0 = 0 _{hex}

1) INVALID_BITS: INVALID BITS MSB + INVALID BITS LSB

3 Integrating the Module in DeviceNet SSI Module Class (VSC116)

4 Integrating the Module in CANopen

Introduction

The support of XN-1SSI modules has been implemented from firmware version V3.00 of XN-GW-CANOPEN.

General

The XN-1SSI module and also the XN-1CNT-24VDC belong to the device group of encoders (in accordance with CANopen Device Profile DS406). The objects listed comprise all the functions of this device group, but are only partially used for the XN-1SSI module.

Encoder-specific default PDOs

These additional PDOs are always set to Invalid by default.

The relevant parameters must be checked before enabling these PDOs. This particularly applies to the COB IDs as these come from the Default Master-Slave Connection and are assigned to other node IDs. The network should not therefore contain nodes with the corresponding node ID, and these nodes should not use the corresponding COB IDs.

The transmission type of these PDOs is normally 255.

Table 15: Overview of the specific default PDOs for the XN-1SSI and XN-1CNT-24VDC encoder modules

PDO	Meaning	COB ID TPDO¹⁾	COB ID TPDO²⁾	COB ID RPDO
PDO9	1st group of encoders (channels 0 + 1)	8000 01E0h + node ID	C000 01E0h + node ID	8000 0260h + node ID
PDO10	2nd group of encoders (channels 2 + 3)	8000 02E0h + node ID	C000 02E0h + node ID	8000 0360h + node ID
PDO11	3rd group of encoders (channels 4 + 5)	8000 03E0h + node ID	C000 03E0h + node ID	8000 0460h + node ID
PDO12	4th group of encoders (channels 6 + 7)	8000 04E0h + node ID	C000 04E0h + node ID	8000 0560h + node ID

1) Applicable from firmware version 2.03

2) Applies to firmware versions before 2.03

Encoders Device Profile Implementation

Overview of Encoders Device Profile Range

The following table provides an overview of the object dictionary entries that are defined by the Device Profile for Encoders CiA/DS406 and are supported by the XI/ON gateway. As this is the 2nd Device Profile of the XI/ON gateway, all entries have an offset of 800h compared to the entries in DS406 (6800_{hex} to 6FFF_{hex}). This section of the object dictionary contains general information, such as device ID, manufacturer name and communication parameters.

The manufacturer-specific objects are in the range 58xx_{hex}.

Object 5800_{hex} – Encoder Basic Mode

This object has no function on the XN-1SSI module.

Object 5801_{hex} – Encoder Config

The **Encoder Config** object has an effect on parameter bytes 0 to 3 of the XN-1SSI module and is used for setting the configuration. Write accesses initiate a parameter update on the XI/ON module bus. The parameter is stored retentively in the gateway and is restored with every node reset.

Table 17: Object 5801_{hex} Description

INDEX	5801 _{hex}
Name	Encoder Config
Object Code	ARRAY
Data type	Unsigned32
Access	rw
Default value	No
PDO Mapping	No

Table 18: Structure of the data bytes

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Byte 0	X	X	DIS_ ERR_ SSI	X	X	X	X	X

Byte 2	X	X	X	X	SSI_BIT_RATE			
Byte 3	SSI_ CODE_ G/D	X	SSI_FRAME_LEN					

4 Integrating the Module in CANopen Encoders Device Profile Implementation

Table 19: Meaning of the data bits

Designation	Value	Description
DIS_ERR_SSI Encoder data cable test	0 ¹⁾	Activate: ZERO test of data cable.
	1	Deactivate After the last valid bit, a ZERO test of the data cable is not carried out.
INVALID_BITS_LSB Number of invalid bits (LSB)	0 to 15	Number of invalid bits on the LSB side of the position value supplied by the SSI encoder. The meaningful word width of the position value transferred to the module bus master is as follows: SSI_FRAME_LEN - INVALID_BITS_MSB - INVALID_BITS_LSB. The invalid bits on the LSB side are removed by shifting the position value to the right, starting with the LSB. INVALID_BITS_MSB + INVALID_BITS_LSB must always be less than SSI_FRAME_LEN. Default 0 Bit = 0 _{hex}

4 Integrating the Module in CANopen Encoders Device Profile Implementation

Designation	Value	Description
INVALID_BITS_MSB Number of invalid bits (MSB)	0 to 7	Number of invalid bits on the MSB side of the position value supplied by the SSI encoder. The meaningful word width of the position value transferred to the module bus master is as follows: SSI_FRAME_LEN - INVALID_BITS_MSB - INVALID_BITS_LSB. The invalid bits on the MSB side are zeroed by masking the position value. INVALID_BITS_MSB + INVALID_BITS_LSB must always be less than SSI_FRAME_LEN. Default: 0 = 0 _{hex}
SSI_BIT_RATE Bit transmission rate	0	1000000 Bit/s
	1 ¹⁾	500000 Bit/s
	2	250000 Bit/s
	3	125000 Bit/s
	4	100000 Bit/s
	5	83000 Bit/s
	6	71000 Bit/s
	7	62500 Bit/s
	8 to 15	Reserve
SSI_FRAME_LEN Number of data frame bits	1 to 32	Number of bits of the SSI data frame. SSI_FRAME_LEN must always be greater than INVALID_BITS. Default: 25 = 19 _{hex}
SSI_CODE_G/D Data format	0 ¹⁾	SSI encoder sends data in binary code
	1	SSI encoder sends data in Gray code

1) Default (factory setting)

4 Integrating the Module in CANopen Encoders Device Profile Implementation

Object 5802_{hex} – Encoder Status

On the XN-1SSI module, bits 6 and 7 of the **Encoder Status** object are emulated for the counter. The bits describe the up/down direction of the current values.

Table 20: Object 5802_{hex} Description

INDEX	5802 _{hex}
Name	Encoder Status
Object Code	ARRAY
Data type	Unsigned8
Access	ro
Default value	No
PDO Mapping	Yes

Table 21: Structure of data byte 6 of the process input

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Byte 6	STS_UP	STS_DN	0	0	0	0	0	0

Table 22: Meaning of the data bits 6 and 7

STS_UP (LED UP)	0	The SSI encoder values are decremented or the values are constant.
	1	The SSI encoder values are incremented.
STS_DN (LED DN)	0	The SSI encoder values are incremented or the values are constant.
	1	The SSI encoder values are decremented.

Object 5803_{hex} – Encoder Flags

On the XN-1SSI module, bits 3 to 6 of the **Encoder Flags** object are emulated as much as possible for the counter. The object comprises the bits **FLAG_CMP1**, **FLAG_CMP2**, **STS_OFLW** and **STS_UFLW**. Unlike the counter module, the bits **STS_OFLW** and **STS_UFLW** SSI module are non-retentive status bits. All other bits are 0.

Writing the object with any value will reset the markers **FLAG_CMP1** and **FLAG_CMP2**. Exception: if the relevant condition for setting a marker is still fulfilled, this marker will continue to remain set.

Table 23: Object 5803_{hex} Description

INDEX	5803 _{hex}
Name	Encoder Flags
Object Code	ARRAY
Data type	Unsigned8
Access	rwr
Default value	No

Table 24: Structure of the data byte

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	STS_UFLW	STS_OFLW	FLAG_CMP2	FLAG_CMP1	0	0	0

Table 25: Meaning of the data bits 3 to 6

FLAG_CMP1	0	Default status, i.e. the register contents have not yet matched (REG_SSI_POS) = (REG_CMP1) since the last reset.
	1	The contents of the registers match: (REG_SSI_POS) = (REG_CMP1). This marker must be reset when CLR_CMP1 = 1 in the process output data.
FLAG_CMP2	0	Default status, i.e. the register contents have not yet matched (REG_SSI_POS) = (REG_CMP2) since the last reset.
	1	The contents of the registers match: (REG_SSI_POS) = (REG_CMP2). This marker must be reset with CLR_CMP2 = 1 in the process output data.
STS_UFLW	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) \geq (REG_LOWER_LIMIT)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_LOWER_LIMIT)
STS_OFLW	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) \leq (REG_UPPER_LIMIT)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) > (REG_UPPER_LIMIT)

Object 5804_{hex} – Encoder Diag

The **Encoder Diag** object reads the diagnostics byte of the XN-1SSI module.

Table 26: Object 5804_{hex} Description

INDEX	5804 _{hex}
Name	Encoder Diag
Object Code	ARRAY
Data type	Unsigned8
Access	ro

X	X	X	ERR_ PARA	STS_ UFLW	STS_ OFLW	ERR_ SSI	SSI_ DIAG

Table 28: Meaning of the data bits

Designation	Value	Description
SSI_DIAG	0	No enabled status signal active: SSI_STSx = 0 or no status messages of the SSI encoder present.
	1	At least one enabled status signal is active: SSI_STSx = 1.
ERR_SSI	0	SSI encoder signal present.
	1	SSI encoder signal faulty (e.g. due to a cable break).
STS_OFLW	0	SSI encoder value below / equal to upper limit.
	1	SSI encoder value above upper limit. Overflow occurred.

4 Integrating the Module in CANopen Encoders Device Profile Implementation

Designation	Value	Description
STS_UFLW	0	SSI encoder value above / equal to lower limit.
	1	SSI encoder value below lower limit. Underflow occurred.
ERR_PARA	0	The parameter set of the module has been accepted.
	1	Operation of the module is not possible with the present parameter set.

Object 5805_{hex} – SSI Native Status

The **SSI Native Status** object reads the bytes 0 to 1 of the process input of the XN-1SSI module.

Writing the object with any value will reset the retentive markers **FLAG_CMP1** and **FLAG_CMP2**. Exception: if the relevant condition for setting a marker is still fulfilled, this marker will continue to remain set.

Table 29: Object 5805_{hex} Description

Encoders Device Profile Implementation

Table 31: Meaning of the data bits

Designation	Value	Description
STS_STOP	0	The SSI encoder is read cyclically.
	1	Communication with the SSI encoder is stopped as STOP = 1 (process output) or ERR_PARA = 1.
ERR_PARA	0	The parameter set of the module has been accepted.
	1	Operation of the module is not possible with the present parameter set.
STS_UFLW	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) \geq (REG_LOWER_LIMIT)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_LOWER_LIMIT)
STS_OFLOW	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) \leq (REG_UPPER_LIMIT)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) > (REG_UPPER_LIMIT)
ERR_SSI	0	SSI encoder signal present.
	1	SSI encoder signal faulty. (e.g. due to a cable break).
SSI_DIAG	0	No enabled status signal is active (SSI_STSx = 0).
	1	At least one enabled status signal is active (SSI_STSx = 1).
STS_UP (LED UP)	0	The SSI encoder values are decremented or the values are constant.
	1	The SSI encoder values are incremented.
STS_DN (LED DN)	0	The SSI encoder values are incremented or the values are constant.
	1	The SSI encoder values are decremented.

4 Integrating the Module in CANopen Encoders Device Profile Implementation

Designation	Value	Description
REL_CMP2	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_CMP2)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) ≥ (REG_CMP2)
FLAG_CMP2	0	Default status, i.e. the register contents have not yet matched (REG_SSI_POS) = (REG_CMP2) since the last reset.
	1	The contents of the registers match: (REG_SSI_POS) = (REG_CMP2). This marker must be reset with CLR_CMP2 = 1 in the process output data.
STS_CMP2	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_CMP2)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) = (REG_CMP2)
REL_CMP1	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) < (REG_CMP1)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) ≥ (REG_CMP1)
FLAG_CMP1	0	Default status, i.e. the register contents have not yet matched (REG_SSI_POS) = (REG_CMP1) since the last reset.
	1	The contents of the registers match: (REG_SSI_POS) = (REG_CMP1). This marker must be reset when CLR_CMP1 = 1 in the process output data.

4 Integrating the Module in CANopen Encoders Device Profile Implementation

Designation	Value	Description
STS_CMP1	0	A comparison of the register contents has produced the following result: (REG_SSI_POS) \neq (REG_CMP1)
	1	A comparison of the register contents has produced the following result: (REG_SSI_POS) = (REG_CMP1)

Object 5806_{hex} – SSI Optional Encoder Status

The **SSI Optional Encoder Status** object reads byte 2 of the process input of the XN-1SSI module. Bits 6 and 7 are masked out.

Table 32: Object 5806_{hex} Description

INDEX	5806 _{hex}
Name	SSI Optional Encoder Status

Access	ro
Default value	No
PDO Mapping	Yes

Table 33: Structure of the data byte

Byte	B7	B6	B5	B4	B3	B2	B1	B0
2	masked (0)	masked (0)	X	X	SSI_ STS3	SSI_ STS2	SSI_ STS1	SSI_ STS0

Table 34: Meaning of the data bits

Designation	Value	Description
SSI_STS3	0	These four bits transfer the status bits of the SSI encoder with the status messages of the SSI module. With some SSI encoders, the status bits are transferred together with the position value.
	1	
SSI_STS2	0	
	1	
SSI_STS1	0	
	1	
SSI_STS0	0	
	1	

Object 5808_{hex} – Encoder Control

Object 5810_{hex} – Counter Load Prepare Value

Object 5811_{hex} – Counter Pulse Width

Object 5820_{hex} – Measuring Integration Time

Object 5821_{hex} – Measuring Low Limit

Object 5822_{hex} – Measuring High Limit

Object 5823_{hex} – Measuring Units per Revolution

These objects have no function on the XN-1SSI module.

Object 5840_{hex} – SSI Diag Mapping

The **SSI Diag Mapping** object writes and reads register 51 (REG_SSI_MASK) of the XN-1SSI module.

The REG_SSI_MASK contains the SSI encoder diagnostics transferred.

Some SSI encoders not only transfer the position value in the data frame that they transfer to the module but also supply additional status messages. It is advisable to include these status messages in the application in order to analyse the measured value.

4 Integrating the Module in CANopen Encoders Device Profile Implementation

Writing the REG_SSI_MASK register allows up to four individual bits to be taken from the SSI encoder data frame and transferred to the SSI_STSx bits of the process input data. It is also possible to output the “SSI encoder group diagnostics message” with an acyclic diagnostics operation when a status message is initiated.

Table 35: Object 5840_{hex} Description

INDEX	5840 _{hex}
Name	SSI Diag Mapping
Object Code	ARRAY
Data type	Unsigned32
Access	rw
Default value	No
PDO Mapping	No

Table 36: Masking with REG_SSI_MASK

Process input data	REG_SSI_MASK									
	Byte	B7	B6	B5	B4	B3	B2	B1	B0	
SSI_STS0	0	EN_D0_RMS0	EN_D0_DS	X	SSI_FRAME_BIT_SEL0					
SSI_STS1	1	EN_D1_RMS1	EN_D1_DS	X	SSI_FRAME_BIT_SEL1					
SSI_STS2	2	EN_D2_RMS2	EN_D2_DS	X	SSI_FRAME_BIT_SEL2					
SSI_STS3	3	EN_D3_RMS3	EN_D3_DS	X	SSI_FRAME_BIT_SEL3					

4 Integrating the Module in CANopen Encoders Device Profile Implementation

Table 37: Meaning of the data bits

Designation	Value	Description
EN_Dx_RMSx	0 ¹⁾	The transfer of the SSI status messages to the process input data is not activated
	1	The transfer of the SSI status messages to the process input data is activated
EN_Dx_DS	0 ¹⁾	The evaluation of the SSI status messages for bit 0 of the diagnostics is not activated
	1	The evaluation of the SSI status messages for bit 0 of the diagnostics is activated.
SSI_FRAME_BIT_SEL	0-31	Definition of the selected bits in the frame of the SSI encoder to be evaluated or copied. Default:0

1) Default

The following applies to bit 0 (SSI group diagnostics) of the diagnostics interface and SSI_DIAG of the process input data:

$$(SSI_STS0 \& EN_D0_DS) \parallel (SSI_STS1 \& EN_D1_DS) \parallel (SSI_STS2 \& EN_D2_DS) \parallel (SSI_STS3 \& EN_D3_DS)$$

Object 6800_{hex} – Operating Parameters

Object 6800_{hex} (corresponds to object 6000_{hex} in accordance with CiA DS406) has no meaning with XI/ON, and only exists because it is a “mandatory” object in accordance with DS406.

Table 38: Object 6800_{hex} Description

INDEX	6800 _{hex}
Name	Operating parameters
Object Code	VAR
Data type	Unsigned16
Access	rw
XI/ON default value	00h
PDO Mapping	No

Object 6810_{hex} – Preset Values for Multi-Sensor Devices

Object 6810_{hex} (corresponds to object 6010_{hex} in accordance with CiA DS406) is used for zero point adaption. The content of this object is added to the value of the SSI encoder. The resulting value is stored in object 6820_{hex}.

Table 39: Object 6810_{hex} Description

INDEX	6810 _{hex}
Name	Position value for multi-sensor devices
Object Code	ARRAY
Data type	Integer32
Access	rw

4 Integrating the Module in CANopen Encoders Device Profile Implementation

INDEX	6810 _{hex}
Default value	No
PDO Mapping	Yes

Object 6820_{hex} – Position Value

Position value for multi-sensor devices

Object 6820_{hex} (corresponds to object 6020_{hex} as per CiA DS406) contains the SSI encoder value of the XN-1SSI module. The content of the object

Preset Values for Multi-Sensor Devices

contains a value that is added to correct the measured value for a zero point adjustment.

Table 40: Object 6820_{hex} Description

INDEX	6820 _{hex}
Name	Position Value for multi-sensor devices
Object Code	ARRAY
Data type	Integer32
Access	ro
Default value	No
PDO Mapping	Yes

Object 6B00_{hex} – CAM State Register

The object **CAM State Register** indicates in accordance with DS406 whether the actual counter status is within the range defined by **CAM1 Low Limit** and **CAM1 High Limit** (object 6B10_{hex} and 6B20_{hex})

Table 41: Object 6B00_{hex} Description

INDEX	6B00 _{hex}
Name	CAM State Register
Object Code	ARRAY
Data type	Unsigned8
Access	ro
Default value	No
PDO Mapping	Yes

Table 42: Meaning of the data byte

Value	Meaning
00 _{hex} (01 _{hex}) ¹⁾	The actual SSI encoder value is outside of the range defined by CAM1 Low Limit and CAM1 High Limit or the comparison function is not activated
01 _{hex} (00 _{hex}) ¹⁾	The actual SSI encoder value is outside of the range defined by CAM1 Low Limit and CAM1 High Limit or the comparison function is not activated

1) If object Cam Polarity register (6B02_{hex}) = 01_{hex}, an inversion will be carried out

Object 6B01_{hex} – CAM Enable Register

The object **CAM Enable Register** defines if the SSI encoder value is to be compared with the values **CAM1 Low Limit** and **CAM1 High Limit** (object 6B10_{hex} and 6B20_{hex}).

Table 43: Object 6B01_{hex} Description

INDEX	6B01 _{hex}
Name	CAM Enable Register
Object Code	ARRAY
Data type	Unsigned8
Access	rw
Default value	No
PDO Mapping	No

Table 44: Meaning of the data byte

Value	Meaning
00 _{hex}	The SSI encoder value is not compared with the values CAM1 Low Limit and CAM1 High Limit (object 6B10 _{hex} and 6B20 _{hex}).
01 _{hex}	The SSI encoder value is compared with the values CAM1 Low Limit and CAM1 High Limit (object 6B10 _{hex} and 6B20 _{hex}).

Object 6B02_{hex} – CAM Polarity Register

The object **CAM Polarity Register** can cause an inversion of the values represented with object 6B00_{hex}.

Table 45: Object 6B02_{hex} Description

INDEX	6B02 _{hex}
Name	Cam polarity register
Object Code	ARRAY
Data type	Unsigned8
Access	rw
Default value	No
PDO Mapping	No

Table 46: Meaning of the data byte

Value	Meaning
00 _{hex}	The value represented with object 6B00 _{hex} is not inverted.
01 _{hex}	The value represented with object 6B00 _{hex} is inverted.

Object 6B10_{hex} – CAM1 Low Limit

The object CAM1 Low Limit defines in accordance with DS406 a lower limit of the counter range.

Object **CAM1 Low Limit** matches the comparison value 2 of the XN-1SSI module.

4 Integrating the Module in CANopen Encoders Device Profile Implementation

Table 47: Object **6B10_{hex}** Description

INDEX	6B10_{hex}
Name	CAM1 Low Limit
Object Code	ARRAY
Data type	Integer32
Access	rw
Default value	No
PDO Mapping	No

Object 6B20_{hex} – CAM1 High Limit

The object **CAM1 High Limit** defines in accordance with DS406 an upper limit of the counter range.

Object **CAM1 High Limit** matches the comparison value 1 of the XN-1SSI module.

Table 48: Object 6B20_{hex} Description

INDEX	6B20_{hex}
Name	CAM1 High Limit
Object Code	ARRAY
Data type	Integer32
Access	rw
Default value	No
PDO Mapping	No

Object 6B30_{hex} - CAM1 Hysteresis

This object has no function on the XN-1SSI module.

Object 6D00_{hex} – Operating Status

**Object 6D01_{hex} - SingleTurn Resolution (rotary),
Measuring Step (linear)**

**Object 6D02_{hex} - Number of
distinguishable revolutions**

The objects 6D00h to 6D02h (correspond to the objects 6500h to 6502h in compliance with CiA DS406) have no meaning for XI/ON and only exist because they are mandatory objects in accordance with DS406. With XI/ON the objects are always set to 0.

Object 6FFF_{hex} - Device Type

Object 6FFFh (corresponds to object 67FFh as per CiA DS406) specifies the type of the second device profile supported. The object is assigned the value 000A 0196_{hex}. The Low word (0196_{hex}) specifies the Device Profile (to CiA DS406: counter module). The High word (000A_{hex}) describes the counter type (10_{dec} = Multi-sensor-encoder interface).

4 Integrating the Module in CANopen Encoders Device Profile Implementation

Table 49: Object 6FFF_{hex} Description

INDEX	6FFF _{hex}
Name	Device Type
Object Code	VAR
Data type	Unsigned32
Access	ro
Default value	000A 0196 _{hex}
PDO Mapping	No

Additional emergencies

The following CANopen emergencies can be triggered by an SSI module:

Error code	Name	Byte 3	Byte 4	Byte 5	Meaning
7000 _{hex}	Additional modules	Module no.	Channel no. (always 1)	0x01	SSI diag
7000 _{hex}	Additional modules	Module no.	1	0x02	SSI error
7000 _{hex}	Additional modules	Module no.	1	0x04	Overflow error
7000 _{hex}	Additional modules	Module no.	1	0x08	Underflow error
7000 _{hex}	Additional modules	Module no.	1	0x10	Parameter error
