**DESCRIPTION**

The hybrid pump is a combination of fixed displacement vane pump B, C, D cartridges combined with a variable cartridge of PV20 or PV29 piston pump. The cartridges are driven by a common shaft without coupling in between they have a large common suction port and two or three independant outlet ports : One for the piston, one or two for the vane pump.

**FEATURES****GREAT FLOW**

T6H20B = 42,9 ml/rev variable + 5,8 to 50,0 ml/rev fixed

T6H20C = 42,9 ml/rev variable + 10,8 to 100,0 ml/rev fixed

T6H29B = 61,9 ml/rev variable + 5,8 to 50,0 ml/rev fixed

T6H29C = 61,9 ml/rev variable + 10,8 to 100,0 ml/rev fixed

T6H29D = 61,9 ml/rev variable + 47,6 to 158,0 ml/rev fixed

T6H29DB = 61,9 ml/rev variable + 47,6 to 158,0 ml/rev fixed + 5,8 to 50,0 ml/rev fixed

**HIGH PRESSURE**

Continuous pressure ratings for variable displacement units are 240 bar for T6H20B/C and 210 bar for T6H29B/C/D/DB.

This combined unit offers the advantage of low noise PV and vane pump which together increase safety and better acceptance of working conditions.

System saving because high pressure allows the use of smaller components... you can down size and gain real savings.

**FLEXIBILITY**

Both units fixed flow and variable flow having separated outlets allow simultaneous machine cycles eg : Mobile machine steering fonction working at the same time as the hydraulic cylinders boom functions.

- One Common suction port.
- P2 rear port 4 or 8 positions - P3 rear port 8 positions.
- Optional internal drain for variable piston pump.
- Compensator venting valve integrated.

Control options on variable displacement (piston pump).

- |   |     |
|---|-----|
| - Compensator   | "C" |
| - Ventable pressure compensator   | "F" |
| - Load sensing compensator  | "L" |
| - Compensator with electric vent valve (only ext. drain) "X" (only T6H20B and T6H20C as standard) |     |

Vane pump cartridge allows great flexibility with many different displacements with easy conversion or renewal.

Wide range of acceptable fluids from 1600 to 10 cSt can operate with mineral oil, biodegradable oil, and fire resistant fluids.

**GENERAL APPLICATIONS  
INSTRUCTIONS**

1. Check speed range, pressure, temperature, fluid quality, viscosity and pump rotation.
2. T6H pump case pressure should not exceed 0,7 bar (see datas).
3. Check inlet conditions of the pump, if it can accept application requirement.
4. Type of shaft : if it would support operating torque.
5. Coupling must be chosen to minimize pump shaft load (weight, misalignment).
6. Filtration : must be adequate for lowest contamination level.
7. Environment of pump : to avoid noise reflection, pollution and shocks.
8. Although the T6H pumps have fast off stroke compensator response, system relief valves are recommended for safety considerations.
9. When constantly under pressure with no flow requirements, it is safer to flush the piston pump. Three drains holes are there for this purpose.

\* = 0 : Industrial application = B : Industrial bi-rotational = M : Mobile application

1) See page 11 for max. pressure f(n).

2) Max. pressure HF-1 same as HF-0 and HF-2.

3) See page 6 for conditions.

HF-0, HF-2 = Antiwear Petroleum Base

HF-1 = Non Antiwear Petroleum Base

HF-5 = Synthetic Fluids

HF-3 = Water in oil Emulsions

HF-4 = Water Glycols

For further information or if the performance characteristics outlined above do not meet your own particular requirements, please consult your local Parker representative.

**PRIMING AT STARTING**

At first start operation of the pump, run it at the lowest speed and at the lowest pressure to obtain priming. When a pressure relief valve is used at the outlet it should be backed off to minimize return pressure. An air bleed off should be provided in the circuit to facilitate the priming. Never operate pump shaft at top speed and pressure without checking for completion of pump priming, and that the fluid is not aerated.

**Always fill the housing of the T6H with oil of circuit prior to start up.**

Vane cartridge : Inlet pressure is measured at inlet flange with petroleum base fluids at viscosity between 10 and 65 cSt. The difference between inlet pressure (at the pump flange) and atmospheric pressure must not exceed 0,2 bar absolute to prevent aeration.

Piston cartridge : Rapid compensation at high speeds can cause severe case spikes. If the pump feeds into a blocked center valve that close quickly, use both case drain ports and direct short case drain lines and a relief valve.

Multiply absolute pressure by 1,25 for HF-3, HF-4 fluids.

by 1,35 for HF-5 fluid.

by 1,10 for ester or rapeseed base.

#### GENERAL CHARACTERISTICS

## CALCULATION

To resolve  
 Volumetric displacement  $V_i$  [m/rev.]  
 Available flow  $Q$  [l/min]  
 Input Power  $P$  [Kw]

Performances required - (P1 - P2)  
 Requested flow  $Q$  [l/min] 60  
 Speed  $n$  [R.P.M.] 1500  
 Pressure  $p$  [bar] 150

## ROUTINE AND EXAMPLE

Routine :

$$1. \text{ First calculation } V_i = \frac{1000 Q}{n}$$

2. Choice  $V_i$  of each section of pump immediately greater

$P_1$  = Piston cartridge T6H20  
 $P_2$  = Vane cartridge (see tabulation)  
 then the pump will be

3. Theoretical flow of this pump

$$Q_{\text{theo.}} = \frac{V_i \times n}{1000}$$

4. Available flow

$P_1$  - Consult the curve "Full flow"

$P_2$ - Find  $q_s$  leakage function of pressure  $q_s = f(p)$  on curve at 10 or 24 cSt  
 $Q = Q_{\text{theo.}} - q_s$

5. Theoretical input power

$P_1$  : Piston section - Consult curve

$$P_2 : \frac{Q_{\text{theo.}} \times p}{600}$$

6. Find  $P_s$  hydrodynamic power loss on curve

7. Total input power

$$P = P(P_1) + P(P_2) + P_s$$

8. Results

Stage P1 : T6H20  $V_i = 42,9$  ml/rev.  
 Stage P2 : Size C 014  $V_i = 46,0$  ml/rev.  
 T6H20C - 014

$$\text{Stage P1} : Q_{\text{theo.}} = \frac{42,9 \times 1500}{1000} = 64,35 \text{ l/min}$$

$$\text{Stage P2} : Q_{\text{theo.}} = \frac{46 \times 1500}{1000} = 69 \text{ l/min}$$

Stage P1 : 1500 R.P.M. at 150 bar = 62 l/min  
 T6H20C (page 15) :

Stage P2 :  $q_s = 5$  l/min at 150 bar, 24 cSt

Stage P2 :  $Q = 69 - 5 = 64$  l/min

T6H20C (page 15)  
 Stage P1 : Curve "Inlet horsepower"  
 1500 R.P.M. at 150 bar = 18 kW

$$\text{Stage P2} : \frac{69 \times 150}{600} = 17,3 \text{ kW}$$

T6H20C (page 15) :  $P_s$  at 1500 R.P.M.,  
 150 bar = 1,5 kW

$$P = 18 + 17,3 + 1,5 = 36,8 \text{ kW}$$

T6H20C - 014

P1	P2
$V_i = 42,9$ ml/rev	$V_i = 46,0$ ml/rev
$Q = 62,0$ l/min	$Q = 64,0$ l/min
Input horsepower	$p = 36,8$ kW

## INTERMITTENT PRESSURE RATING

Piston cartridge section (P1) may be operated at an intermittent pressure but 10% of operation time only, not exceeding 6 successive seconds.

Vane cartridge section units may be operated intermittently at pressures higher than the recommended continuous rating when the time weighted average of pressure is less than or equal to the continuous duty pressure rating.

This intermittent pressure rating calculation is only valid if other parameters; speed, fluid, viscosity and contamination level are respected.

For total cycle time higher than 15 minutes please consult your Parker representative.

Example : T6H20C - 014

P2 - Duty cycle 4 min. at 275 bar

1 min. at 35 bar

5 min. at 160 bar

$$\frac{(4 \times 275) + (1 \times 35) + (5 \times 160)}{10} = 193,5 \text{ bar}$$

193,5 bar is lower than 240 bar allowed as continuous pressure for T6H20C - 014 with HF-0 fluid.

**FLUID POWER FORMULAS**

Pump input torque N.m  $\frac{\text{pressure (bar)} \times \text{displacement (ml/rev)}}{20\pi \times \text{mech. eff.}}$

Pump input power kW  $\frac{\text{speed (rpm)} \times \text{displacement (ml/rev)} \times \text{pressure (bar)}}{600000 \times \text{overall eff.}}$

Pump output flow Lpm  $\frac{\text{speed (rpm)} \times \text{displacement (ml/rev)} \times \text{volumetric eff.}}{1000}$

Fluid motor speed rpm  $\frac{1000 \times \text{flow rate (Lpm)} \times \text{volumetric eff.}}{\text{displacement (ml/rev.)}}$

Fluid motor torque N.m  $\frac{\text{pressure (bar)} \times \text{displacement (ml/rev)} \times \text{mech. eff.}}{20\pi}$

Fluid motor power kW  $\frac{\text{speed (rpm)} \times \text{displacement (ml/rev)} \times \text{pressure (bar)} \times \text{overall eff.}}{600000}$

#### APPLICATION ADVANTAGES

- The high pressure capability to 240 bar, in the small envelope, reduces installation costs and provides extended life at reduced pressure.
- The high volumetric efficiency, typically 94%, reduces heat generation, and allows speeds down to 600 RPM (400 RPM for mobile) at full pressure.
- The high mechanical efficiency, typically 94%, reduces energy consumption.
- The wide speed range from 600 RPM to 2600 RPM (400 RPM to 2600 RPM for mobile), combined with large size cartridge displacements, will optimize operation for the lowest noise level in the smallest envelope.
- The low speed 600 RPM (400 RPM for mobile), low pressure, high viscosity 860 cSt (1600 cSt for mobile) allow application in cold environments with a minimum energy consumption and without of seizure risk.
- The low ripple pressure ± 2 bar reduces piping noise and increases life time of the other components in the circuit.
- The high resistance to particle contamination because of the double lip vane increases pump life.
- The large variety of options (cam displacement, shaft, porting, piston section controls) allows customized installation.

**C - COMPENSATOR**

The "C" and "F" pressure compensator control allows the pump to deliver full volume from the outlet port until the pressure rise to the value set by the control. The control then reduces the pump volume to that required by the system mobile maintaining the preset pressure at the outlet port.

**F - VENTABLE COMPENSATOR**

The "F" compensator is used in applications requiring remote control pressure. The remote relief is connected to the vent port. The pressure may be controlled at any level below the compensator pressure setting. The vent port may also be used to remotely vent-off the compensator for starting.

**L - LOAD SENSING COMPENSATOR**

The "L" compensator is used for load sensing circuits and is a true load sensor. This is the "F" compensator with a pin in the compensator spool (see enlarged view). The pin prevents pilot flow from entering the circuit which will eliminate creeping of the load. The "L" compensator will let the pump deliver a constant flow rate to the circuit by providing an adjustable  $\Delta P$  across the customer's orifice or valve. The pump will operate at 17 - 28 bar above "Load Pressure".

**X - VENTED COMPENSATOR BY ELECTRIC VALVE**

The "X" compensator is used in application requiring vent off on compensator at starting or at other time of the cycle. The piston cartridge reduce the volume for maintaining the pressure at the differential pressure setting.

**FLUIDS**

**RECOMMENDED FLUIDS**

Petroleum based antiwear R & O fluids.

These fluids are the recommended fluids for T6 series pumps. Maximum catalogue ratings and performance data are based on operation with these fluids. These fluids are covered by Denison HF-0 and HF-2 specification.

**ACCEPTABLE ALTERNATE  
FLUIDS**

The use of fluids other than petroleum based antiwear R & O fluids, requires that the maximum ratings of the pumps will be reduced. In some cases the minimum replenishment pressures must be increased. Consult specific sections for more details.

**VISCOSITY**

Max (cold start, low speed & pressure)	860 mm <sup>2</sup> /s (cSt)
Max (cold start, low speed & pressure) (for mobile)	1600 mm <sup>2</sup> /s (cSt)
Max (full speed & pressure)	108 mm <sup>2</sup> /s (cSt)
Optimum (max. life)	30 mm <sup>2</sup> /s (cSt)
Min (full speed & pressure for HF-1, HF-3, HF-4 & HF-5 fluids)	18 mm <sup>2</sup> /s (cSt)
Min (full speed & pressure for HF-0 & HF-2 fluids)	13 mm <sup>2</sup> /s (cSt)

**VISCOSITY INDEX**

90° min. higher values extend range of operating temperatures.

Maximum fluid temperature ( $\theta$ ) °C

HF-0, HF-1, HF-2	+ 100°C
HF-3, HF-4	+ 50°C
HF-5	+ 70°C
Biodegradable fluids (esters & rapeseed base)	+ 65°C

Minimum fluid temperature ( $\theta$ ) °C

HF-0, HF-1, HF-2, HF-5	- 18°C
HF-3, HF-4	+ 10°C
Biodegradable fluids (esters & rapeseed base)	- 20°C

**FLUID CLEANLINESS**

The fluid must be cleaned before and during operation to maintain contamination level of NAS 1638 class 8 (or ISO 19/17/14) or better. Filters with 25 micron (or better, B10 ≥ 100) nominal ratings may be adequate but do not guarantee the required cleanliness levels. Suction strainers must be of adequate size to provide minimum inlet pressure specified. 100 mesh (149 micron) is the finest mesh recommended. Use oversize strainers or omit them altogether on applications which require cold starts or use fire resistant fluids.

**OPERATING TEMPERATURES  
AND VISCOSITIES**

Operating temperatures are a function of fluid viscosities, fluid type, and the pump. Fluid viscosity should be selected to provide optimum viscosity at normal operating temperatures. For cold starts the pumps should be operated at low speed and pressure until fluid warms up to an acceptable viscosity for full power operation.

**WATER CONTAMINATION IN  
THE FLUID**

Maximum acceptable content of water.

- 0.10% for mineral base fluids.
  - 0.05% for synthetic fluids, crankcase oils, biodegradable fluids.
- If amount of water is higher then it should be drained off the circuit.

**SHAFTS****COUPLINGS AND FEMALE SPLINES  
SPLINES**

- The shafts will accept a maximum misalignment of 0.06 TIR when the pump is foot mounted and 0.03 mm when flange mounted. The angular alignment of two spline axes must be less than 0.1° (0.002 mm/mm).
- The coupling spline must be lubricated with a lithium molydisulfide grease or a similar lubricant.
- The coupling must be hardened to a hardness between 27 and 45 R.C.
- The female spline must be made to conform to the Class 1 fit as described in SAE-J498b (1971). This is described as a Flat Root Side Fit.

**KEYED SHAFTS**

We supply the T6H series keyed shaft pumps with high strength heat-treated keys. Therefore, when installing or replacing these pumps, the heat-treated keys must be used in order to insure maximum life in the application. If the key is replaced it must be a heat-treated key between 27 and 34 R.C. hardness. The corners of the keys must be chamfered from 0.76 to 1.02 at 45° to clear radius in the key way.

**NOTE****SHAFT LOADS**

Alignment of keyed shafts must be within tolerances given for splined shafts.

These products are designed primarily for coaxial drives which do not impose axial or side loading on the shaft. Consult the typical curve below for the theoretical life. For specific applications which may include vibration and shock during operation of the machine or external load on the drive shaft. Please consult your local Parker representative
