#### **Model Number**

### MLV12-54-G/32/124

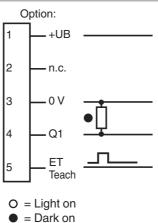

Retroreflective sensor with 5-pin M12 connector, 90° adjustable position

#### **Features**

- Series of sensors in a widely used ٠ standard housing
- Reliable recognition of reflective ob-• jects and clear glass
- TEACH-IN switch for setting the contrast detection levels
- Automatic adjustment in case of soi-٠ ling in contrast detection mode
- High level of stability thanks to the me-٠ tal housing frame
- Resistant against noise: reliable ope-٠ ration under all conditions

#### **Curves/Diagrams**

# **TEACH-IN**

• Switch position "N" (normal operation): Yellow LEDs light if the light beam is free, flash if the functional reserve is used, turn off if the light beam is interrupted. • Switch position "T" (TEACH-IN operation): Yellow LED flashes slowly after 1 second (about 1.5 Hz). The sensor is now ready to be set to a particular contrast detection value using the mechanical switch (position I, II, or III) or an external signal. · Switch positions "I", "II", and "III" (contrast detection operation) Contrast detection values: I for 10 %, II for 18 %, III for 40 % 1. Yellow LED lights continually: light path free 2. Yellow LED off: object detected 3. Yellow LED flashes quickly: unsure detection, too much contamination, functional reserve too low. A direct switching of the contrast detection levels is possible without having to put the switch back into position "T" first. • External teach input (ET): In switch position "T", you can apply a pulse over a control line to plug pin 5 to select the corresponding contrast detection. The desired contrast detection is set by applying a high pulse of a particular width: 50 ms (30 ms ... 100 ms) Ŀ II: 150 ms (100 ms ... 200 ms) III: >200 ms Pre-fault output (optional): Switch position "N": Inactive if the functional reserve is used after approx. 5 sec. Immediately inactive if 4 light beam interruptions occur within the flashing time. Contrast detection levels: The output goes inactive if the contamination no longer permits readjustment; the yellow LED flashes quickly. In the case of additional contamination, the detection of low contrast is no longer guaranteed. • Warm-up period: Any warm-up period can be shortened by repeating the learn (teach) process.
