Dimensions

CE **OIO**-Link c US

### **Model Number**

#### MLV41-8-H-120-RT-IO/65b/92/136

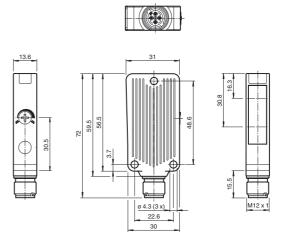

Background suppression sensor with 4-pin, M12 x 1 connector

#### **Features**

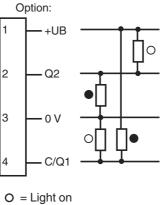

- Rugged series in corrosion-resistant • metal housing
- MPT Multi Pixel Technology ٠
- IO-link interface for service and pro-• cess data
- Reliable detection of all surfaces, in-• dependent of color and structure
- Precision background suppression, • adjustable
- Low sensitivity to target color
- Clear and functional display concept • for the operating modes

### **Product information**

The diffuse mode sensor with MPT technology combines the benefits of the triangulation principle with the measuring functionality of a distance sensor. The integrated measuring principle provides an extremely wide range of switching element functions in one device, along with a large detection range and a small black/white difference up to the final detection range. The sensor is equipped with an IO-Link interface, through which the measuring principle is optimized to the requirements of the relevant application.

#### **Curves/Diagrams**

#### Setting information

#### **Detection range adjustment:**

The detection range can be set via the rotary switch or the IO-Link.

#### Setting using the rotary switch:

If you would like to change the detection range on the sensor, turn:

- · the rotary switch to the left to reduce the value.
- the rotary switch to the right to increase the value.

With the IO-Link, the set detection range the current rotary switch configuration is always assigned. If the rotary switch is too far to the left or the right, perform the following:

#### Increasing the detection range:

Turn the potentiometer completely to the right until it stops. The LED will briefly flash green. The assignment of the current rotary switch configuration to the detection range set via IO-Link is overridden. Now set the desired detection range again.

#### Reducing the detection range:

Turn the potentiometer completely to the left until it stops. The LED will briefly flash green. The assignment of the current rotary switch configuration to the detection range set via IO-Link is overridden. Now set the desired detection range again.

#### Example application - manually reduce detection range:

The potentiometer has one position as shown here. The adjustable detection range is 20 to 120 mm and is set via IO-Link to 100 mm. The rotary switch is too far to the left to set a detection range of 40 mm for example.

Turn the potentiometer to the left until it stops to override the set value to this rotary switch configuration. The LED will briefly flash green.

Now set the desired detection range again between 20 and 120 mm.

#### Setting via IO-Link interface

#### Setting different operating modes via IO-Link interface

The devices have an IO-Link interface as standard for diagnostic and parameterization tasks enabling optimum adaptation of the sensors to the application. In addition, four different operating modes can be set:

#### Background suppression operating mode (1 or 2 switching points):

- Detection of objects irrespective of type and color in a defined sensing range. Objects in the background are reliably suppressed
- Background suppression with 2 switching points
