Adjustment

Small object detection

The focal point of the emitter can be adjusted. Very small objects are best detected at the focal point (place of smallest spot size).

Whether a small object can be detected or not depends on the emitter/receiver as well as on the emitter/object distance. Please see the corresponding curves enclosed.

For long distance application, you have to avoid a short focal plane setting. The maximum light spot diameter at the receivers location must not exceed 100 mm for reliable detection with 2-fold function reserve.
