#### 10 EU Declaration of conformity

# 1. About this document

#### 1.1 Function

6

6.1

62

This operating instructions manual provides all the information you need for the mounting, set-up and commissioning to ensure the safe operation and disassembly of the safety switchgear. The operating instructions must be available in a legible condition and a complete version in the vicinity of the device.

#### 1.2 Target group: authorised qualified personnel

All operations described in this operating instructions manual must be carried out by trained specialist personnel, authorised by the plant operator only.

Please make sure that you have read and understood these operating instructions and that you know all applicable legislations regarding occupational safety and accident prevention prior to installation and putting the component into operation.

The machine builder must carefully select the harmonised standards to be complied with as well as other technical specifications for the selection, mounting and integration of the components.

1.3 Explanation of the symbols used

Information, hint, note: This symbol is used for identifying useful additional information.

**Caution:** Failure to comply with this warning notice could lead to failures or malfunctions. **Warning:** Failure to comply with this warning notice could lead to physical injury and/or damage to the machine.

#### 1.4 Appropriate use

ĭ

The products described in these operating instructions are developed to execute safety-related functions as part of an entire plant or machine. It is the responsibility of the manufacturer of a machine or plant to ensure the correct functionality of the entire machine or plant.

The safety switchgear must be exclusively used in accordance with the versions listed below or for the applications authorised by the manufacturer. Detailed information regarding the range of applications can be found in the chapter "Product description".

#### 1.5 General safety instructions

The user must observe the safety instructions in this operating instructions manual, the country-specific installation standards as well as all prevailing safety regulations and accident prevention rules.

Further technical information can be found in the Schmersal catalogues or in the online catalogue on the Internet: www.schmersal.net.

The information contained in this operating instructions manual is provided without liability and is subject to technical modifications. There are no residual risks, provided that the safety instructions as well as the instructions regarding mounting, commissioning, operation and maintenance are observed.

## 1.6 Warning about misuse

In case of improper use or manipulation of the safety switchgear, personal hazards or damages to machinery or plant components cannot be excluded when safety switchgear is used. The relevant requirements of the standard ISO 14119 must be observed.

#### 1.7 Exclusion of liability

We shall accept no liability for damages and malfunctions resulting from defective mounting or failure to comply with this operating instructions manual. The manufacturer shall accept no liability for damages resulting from the use of unauthorised spare parts or accessories.

For safety reasons, invasive work on the device as well as arbitrary repairs, conversions and modifications to the device are strictly forbidden; the manufacturer shall accept no liability for damages resulting from such invasive work, arbitrary repairs, conversions and/or modifications to the device.

### 2. Product description

#### 2.1 Ordering code

#### AZM3001-2-ST-3-4-5

No.	Option	Description
1	z	Solenoid interlock monitored
	В	Actuator monitored
2		Standard coding
	11	Individual coding
	12	Individual coding, re-teaching enabled
3	1P2P	1 p-type diagnostic output and
		2 p-type safety outputs
	SD2P	Serial diagnostic output and
		2 p-type safety outputs
4		Power to unlock
	A	Power to lock
5		Manual release
	N	Emergency release
	Т	Emergency exit
	T8	Emergency exit, distance 8.5 mm

#### Actuator AZ/AZM300-B1

#### 2.2 Special versions

For special versions, which are not listed in the order code below 2.1, these specifications apply accordingly, provided that they correspond to the standard version.

#### 2.3 Comprehensive quality insurance to 2006/42/EC

Schmersal is a certified company to appendix X of the Machinery Directive. As a result, Schmersal is entitled to autonomously conduct the conformity assessment procedure for the products listed in Appendix IV of the MD without involving a notified body. The prototype test certificates are available upon request or can be downloaded from the Internet at www.schmersal.com.

#### 2.4 Destination and use

The AZM 300 with non-contact electronic safety sensors is designed for application in safety circuits and is used for monitoring the position of movable safety guards.

The different variants can be used as safety switch with interlocking function either as solenoid interlock.

If the risk analysis indicates the use of a monitored interlock then a variant with the monitored interlock is to be used, labelled with the symbol. The actuator monitoring variant (B) is a safety switch with an interlock function for process protection.

The safety function consists of safely switching off the safety outputs when the safety guard is unlocked or opened and maintaining the safe switched off condition of the safety outputs for as long as the safety guard is open.

Interlocks with power to lock principle may only be used in special cases after a thorough evaluation of the accident risk, since the safety guard can be opened immediately on failure of the power supply or upon activation of the main switch.

#### Emergency exit (-T/-T8)

Fitting and actuation only from within the hazardous area.

To activate the emergency exit, turn the red lever in the direction of the arrow to the end stop. The safety outputs switch off and the guard system can be opened. The blocked position is cancelled by turning the lever in the opposite direction. In the unlocked position, the guard system is secured against unintentional locking.

#### Emergency release (-N)

Mounting and actuation only outside of the safety guard.

To activate the emergency release turn the red lever in the direction of the arrow to the end stop. The safety outputs switch off and the guard system can be opened. The lever is latched and cannot be returned to its original position. To cancel the blocking condition, the central mounting screw must be loosened to such extent that the lever can be turned back into its original position. The screw must then be re-tightened.

#### Series-wiring

Series-wiring can be set up. The response and risk times are not altered by wiring in series. The number of components is only limited by the external cable protection according to the technical data and the line loss. Series-wiring of up to 31 AZM300 ... SD components with serial diagnostics is possible. In devices with the serial diagnostics function (ordering suffix -SD), the serial diagnostics connections are wired in series and connected to a SD Gateway for evaluation purposes. Wiring examples for series-wiring, refer to appendix.

The user must evaluate and design the safety chain in accordance with the relevant standards and the required safety level. If multiple safety sensors are involved in the same safety function, the PFH values of the individual components must be added.

The entire concept of the control system, in which the safety component is integrated, must be validated to the relevant standards.

#### 2.6 Safety classification

- of the interlocking function:	
Standards:	ISO 13849-1, IEC 61508, IEC 62061
PL:	е
Control Category:	4
PFH:	5.2 x 10 <sup>-10</sup> / h
PFD:	4.5 x 10 <sup>-5</sup>
SIL:	suitable for SIL 3 applications
Service life:	20 years

#### - of the guard locking function:

Standards:	ISO 13849-1, IEC 61508 , IEC 62061
PL:	d
Control Category:	2
PFH:	2.0 x 10 <sup>-9</sup> / h
PFD:	1.8 x 10 <sup>-4</sup>
SIL:	suitable for SIL 2 applications
Service life:	20 years

The safety consideration of the guard locking function only applies for standard devices with monitored solenoid interlock AZM300Z-...-1P2P-... (see Ordering code).

The actuation of the interlock must be compared with the external OSSD enabler. If a shut-down now occurs due to an unintentional unlocking this is detected by an external diagnostic.

If for a certain application the quiescent current version of a solenoid interlock cannot be used, then for this exception an interlock with power to lock can be used if additional safety measure need to be realised that have an equivalent safety level.

# SCHMERSAL

actuation and safe cable installation to prevent faults are to be implemented.

In the event of a fault resulting in the unlocking of the guard locking, this is detected by the solenoid interlock and the safety gates Y1/Y2 switch off. When such a fault occurs the protection equipment may open immediately, just once, before the safe condition of the machine is reached. The system reaction of category 2 allows that a fault can occur between tests causing the loss of the safety function which is detected by the test.

## 3. Mounting

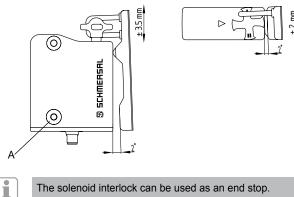

#### 3.1 General mounting instructions

Please observe the remarks of the standards ISO 12100, EN 953 and ISO 14119.

The safety component and the actuator must be permanently fitted to the safety guards and protected against displacement by suitable measures (tamperproof screws, gluing, drilling, pinning).

For the correct fixing of the solenoid interlock and the actuator, two mounting holes for M6 screws are provided (tightening torque:  $5 \dots 6$  Nm).

Any mounting position. The system must only be operated with an angle of  $\leq 2^{\circ}$  between the solenoid interlock and the actuator. When mounting the solenoid interlock onto metallic surfaces, a galvanic connection must be realised between the mounting surface and fixing point "A".

The solenoid interlock can be used as an end stop. Dependant upon the door weight and the actuating speed, the mechanical life could be reduced.

#### Mounting of the solenoid interlock and the actuator

Refer to the mounting instructions manual for the corresponding actuator.

# Actuating directions

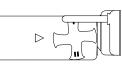

Provide for a sufficient insertion of the actuator into the rotary handle

Correct

False

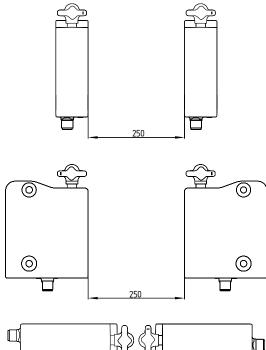

To avoid any interference inherent to this kind of system and any reduction of the switching distances, please observe the following guidelines: • The presence of metal chips in the vicinity of the solenoid interlock is

- liable to modify the switching distance.
- Keep away from metal chips.

#### Observe the minimum distance between two solenoid interlocks

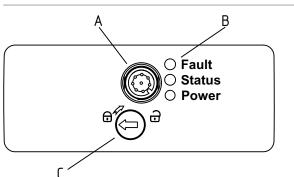

#### 3.2 Manual release

For the machine set-up, the solenoid interlock can be unlocked in a de-energised condition. The solenoid interlock is unlocked by turning the manual release in the position  $\overline{\textcircled{O}}$ .

The normal locking function is only restored after the manual release has been returned to its original position 0 .

#### Caution: do not turn beyond the end stop!

After being put into operation, the manual release must be sealed by means of the seal, which is included in delivery.

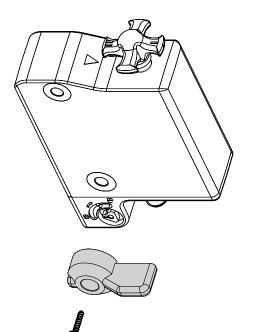

#### Key

- A: Connector plug M12, 8-pole B: LED indications
- C: Manual release

## 3.3 Emergency exit -T/-T8 or emergency release -N

With variants that have both emergency exit and emergency release, the red lever is loosely supplied. The lever should be fastened to the position intended with the supplied screws before first being used. The lever should be installed on the unlocking triangle in such a way that the arrow on the triangle and the lever pivot are congruent. The installation of the lever is possible on both sides. The opposite is to be sealed with the seal included with delivery.

Emergency exit (-T/-T8) Fitting and actuation only from within the hazardous area.

# Emergency release (-N)

Mounting and actuation only outside of the safety guard.

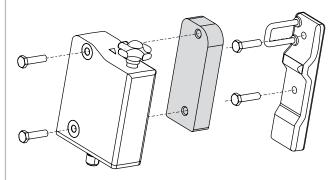

The emergency release should only be used in an emergency. The solenoid interlock should be installed and/or protected so that an inadvertent opening of the interlock by an emergency release can be prevented.

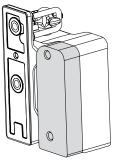

The emergency release must be clearly labelled that it should only be used in an emergency. The label can be used that was included in the delivery. To ensure correct operation of emergency exit -T/-T8 and emergency release -N, the safety door/guard must not be in a mechanically tensioned state.

## 3.4 Mounting with mounting plate

i

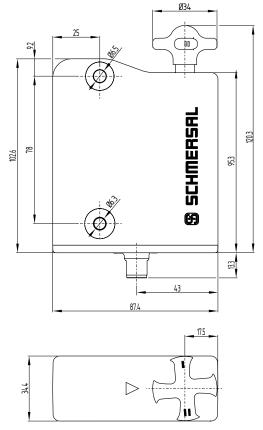

For doors, which close flush with the door frame, the optional mounting late MP-AZ/AZM300-1 can be used.

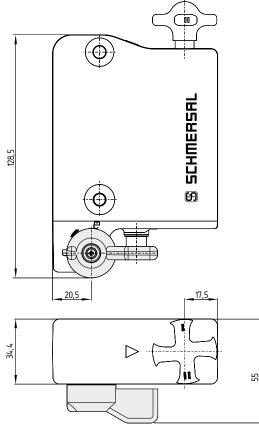

#### **3.5 Dimensions** All measurements in mm.

#### AZM300

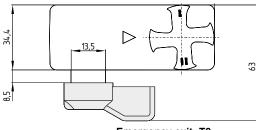

# AZM300...-T/-T8 and -N

Device with emergency exit or emergency release

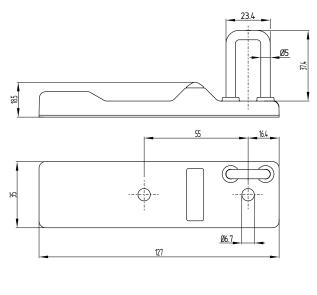

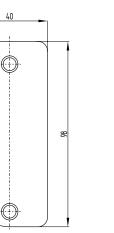

Emergency exit -T8

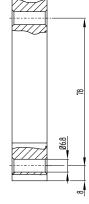

## 3.6 Actuator and accessories

# Actuator AZ/AZM300-B1 (not included in delivery)

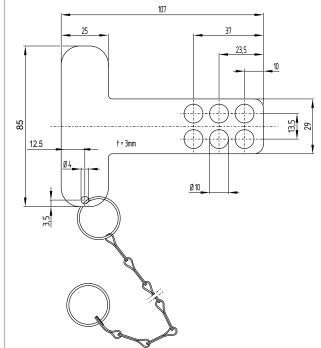

Mounting plate MP-AZ/AZM300-1 (available as accessory)

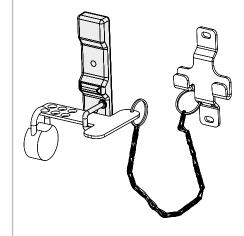

18.5

Lockout tag SZ 200-1 (available as accessory)

## 4. Electrical connection

#### 4.1 General information for electrical connection

i

i

i

i

The electrical connection may only be carried out by authorised personnel in a de-energised condition.

The voltage inputs A1, X1, X2 and IN must have a protection against permanent overvoltage. supply units according to IEC 60204-1 is recommended.

The safety outputs can be integrated in the safety circuit of the control system.

Requirements for the connected safety-monitoring module:

Dual-channel safety input, suitable for p-type semi-conductor outputs

**Configuration of the safety-monitoring module** If the safety sensor is connected to electronic safetymonitoring modules, we recommend that you set a discrepancy time of min. 100 ms. The safety inputs of the safety-monitoring module must be able to blank a test impulse of approx. 1 ms. The safety-monitoring module does not need to have a cross-wire short monitoring function, if necessary, the cross-wire short monitoring function must be disabled.

Information for the selection of suitable safety-monitoring modules can be found in the Schmersal catalogues or in the online catalogue on the Internet: www.schmersal.net.

#### Cable design in case of serial diagnostics

When wiring SD devices, please observe the voltage drop on the cables and the current carrying capacity of the individual components.

The wiring capacity of the connecting cable of the solenoid interlock must not exceed 50 nF. Depending on the strand structure, normal unshielded 30 m long control cables LIYY 0.25 mm<sup>2</sup> to 1.5 mm<sup>2</sup> have a wiring capacitance of approx. 3 ... 7 nF.

#### Accessories SD interface

For ease of wiring and series-wiring of SD devices, considerable accessories are available. Detailed information is available on the Internet, www.schmersal.net.

5. Operating principles, coding and latching adjustment

#### 5.1 Magnet control

In the power to unlock version of the AZM300, the solenoid interlock is unlocked when the IN signal (= 24V) is set. In the power to lock version of the AZM300, the solenoid interlock is locked when the IN signal (= 24 V) is set.

#### 5.2 Mode of operation of the safety outputs

In the standard AZM 300Z variant, the unlocking of the solenoid interlock causes the safety outputs to be disabled. The unlocked safety guard can be relocked as long as the actuator is inserted in the AZM 300Z solenoid interlock; in that case, the safety outputs are re-enabled. The safety guard must not be opened.

In the AZM300B version, only the opening of the safety guard causes the safety outputs to be disabled.

If the safety outputs are already enabled, any error that does not immediately affect the functionality of the solenoid interlock (e.g. too high an ambient temperature, interference potential at the safety outputs, cross-wire short) will lead to a warning message, the disabling of the diagnostic output and the delayed shutdown of the safety outputs. The safety outputs are disabled if the error warning is active for 30 minutes. The signal combination, diagnostic output disabled and safety channels still enabled, can be used to stop the production process in a controlled manner. After the rectification of the error, the error message is reset by opening the corresponding safety guard. For devices with serial diagnostic, a bit can be set/ deleted in the call telegram to reset the fault.

#### 5.3 Actuator teaching / actuator detection

Solenoid interlocks with standard coding are ready to use upon delivery.

Individually coded solenoid interlocks and actuators will require the following "teach-in" procedure:

- 1. Switch the solenoid interlock's voltage supply off and back on.
- Introduce the actuator in the detection range. The teach-in procedure is signalled at the solenoid interlock, green LED off, red LED on, yellow LED flashes (1 Hz).
- 3. After 10 seconds, brief yellow cyclic flashes (3 Hz) request the switch-off of the operating voltage of the solenid interlock. (If the voltage is not switched off within 5 minutes, the solenoid interlock cancels the "teachin" procedure and signals a false actuator by 5 red flashes).
- 4. After the operating voltage is switched back on, the actuator must be detected once more in order to activate the taught actuator code. In this way, the activated code is definitively saved!

For ordering suffix -11, the thus executed allocation of safety switchgear and actuator is irreversible.

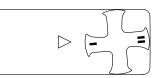

For ordering suffix -12, the "teach-in" procedure for a new actuator can be repeated an unlimited number of times. When a new actuator is taught, the code, which was applicable until that moment, becomes invalid. Subsequent to that, an enabling inhibit will be active for ten minutes, thus providing for an increased protection against tampering. The green LED will flash until the expiration of the time of the enabling inhibit and the detection of the new actuator. In case of power failure during the lapse of time, the 10-minutes tampering protection time will restart.

#### 5.4 Latching force adjustment

In order to enable trouble-free functionality of the device, the rotary handle must be in position I or II when the safety guard is open. In the intermediate positions, locking is impossible.

The latching force is changed by turning the rotary handle by 180°. In position I, the latching force is approx. 25 N.

In position II, the latching force is approx. 50 N.

# 6. Diagnostic function

# 6.1 Diagnostic-LEDs

The solenoid interlock signals the operating condition, as well as errors through 3-colour LED's.

green (Power)	Supply voltage on
yellow (Status)	Operating condition
red (Fault)	Fault (see Table 2: Flash codes of the red diagnostic LED)

# 6.2 Solenoid interlock with conventional diagnostic output

The short-circuit proof diagnostic output OUT can be used for central visualisation or control functions, e.g. in a PLC.

# The diagnostic output is not a safety-related output!

#### Error

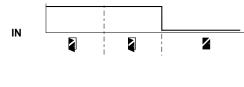

Errors, which no longer guarantee the function of the solenoid interlock (internal errors) cause the safety outputs to be disabled immediately. Any error that does not immediately affect the safe functionality of the AZM300 solenoid interlock (e.g. cross-wire short, temperature error, safety output, short circuit to +24 VDC) will lead to a delayed shut-down (refer to table 2). After the rectification of the error, the error message is reset by opening the corresponding safety guard.

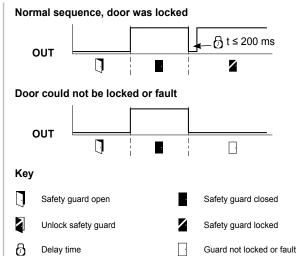

#### Error warning

A fault has occurred, which causes the safety outputs to be disabled after 30 minutes (LED "fault" flashes, see Table 2). The safety outputs initially remain enabled. This enables the shutdown of the process in a controlled manner. An error warning is deleted when the cause of error is eliminated.

#### Behaviour of the diagnostic output

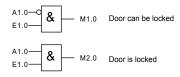

#### Evaluation of the diagnostic outputs

SPS		AZM 300
A1.0	$\rightarrow$	IN
E1.0	$\rightarrow$	OUT

Power to unlock: IN = 0 = locking A1.0 & M1.0 Door can be locked A1.0 & M2.0 Door is locked E1.0 & M2.0 Door is locked

Power to lock: IN = 1 = locking

## Diagnostic information

#### Table 1: Diagnostic information of the safety switchgear

The safety switch signals the operational state as well as errors through three coloured LED's installed on the device.

System condition	Solenoid control IN		LED		Safety outputs Y1, Y2		Diagnostic output	
	Power to unlock	Power to lock	green	red	yellow	AZM300Z	AZM300B	OUT
Safety guard open	24 V (0 V)	0 V (24 V)	On	Off	Off	0 V	0 V	0 V
Door closed, not locked	24 V	0 V	On	Off	Flashes	0 V	24 V	24 V
Door closed, locking impossible	0 V	24 V	On	Off	Flashes	0 V	24 V	0 V
Door closed and locked	0 V	24 V	On	Off	On	24 V	24 V	24 V
Error warning <sup>1)</sup>	0 V	24 V	On	Flashes 2)	Off	24 V <sup>1)</sup>	24 V <sup>1)</sup>	0 V
Error	0 V (24 V)	24 V (0 V)	On	Flashes 2)	Off	0 V	0 V	0 V
Additionally for variant I1/I2:								
Teach-in procedure actuator			Off	On	Flashes	0 V	0 V	0 V
started								
Only I2: teach-in procedure			Flashes	Off	Off	0 V	0 V	0 V
actuator (release block)								

(EN)

1) after 30 min: disabling due to fault

2) refer to flash code

## Table 2: Error messages / flash codes red diagnostic LED

Flash codes (red)	Designation	Autonomous switch-off after	Error cause
1 flash pulse	Error (warning) at output Y1	30 min	Fault in output test or voltage at output Y1, although the output is disabled.
2 flash pulses	Error (warning) at output Y2	30 min	Fault in output test or voltage at output Y2, although the output is disabled.
3 flash pulses	Error (warning) cross-wire short	30 min	Cross-wire short between the output cables or fault at both outputs
4 flash pulses	Error (warning) temperature too high	30 min	The temperature measurement reveals an internal temperature that is too high
5 flash pulses	Actuator fault	0 min	Incorrect or defective actuator, bracket broken
6 flash pulses	Fault rotary handle	0 min	Rotary handle not in authorised intermediate position
Continuous red signal	Internal error	0 min	Device defective

#### 6.3 Solenoid interlock with serial diagnostic function SD

Solenoid interlocks with serial diagnostic cable have a serial input and output cable instead of the conventional diagnostic output. If solenoid interlocks are wired in series, the diagnostic data are transmitted through the series-wiring of the inputs and outputs.

Max. 31 solenoid interlocks can be wired in series. For the evaluation of the serial diagnostics line either the PROFIBUS-Gateway SD-I-DP-V0-2 or the Universal-Gateway SD-I-U-... are used. This serial diagnostic interface is integrated as a slave in an existing field bus system. In this way, the diagnostic signals can be evaluated by means of a PLC.

The response data and the diagnostic data are automatically and permanently written in an input byte of the PLC for each solenoid interlock in the series-wired chain. The request data for each solenoid interlock is transmitted to the component through an output byte of the PLC. In case of a communication error between the field bus gateway and the solenoid interlock, the switching condition of the solenoid interlock is maintained.

#### Error

A fault has occured, which causes the safety outputs to be disabled. The fault is reset, when the cause is eliminated and bit 7 of the request byte changes from 1 to 0 or the safety guard is opened. Faults at the safety outputs are only deleted upon the next release, as the fault rectification cannot be detected sooner.

If more than one fault is detected at the safety outputs, the AZM 300 will be electronically locked and a normal fault reset will no longer be possible. To reset this type of interlocking, the AZM 300, must be isolated from the power supply after elimination of the error causes.

#### Error warning

A fault has occurred, which causes the safety outputs to be disabled after 30 minutes. The safety outputs initially remain enabled. This enables the shutdown of the process in a controlled manner. An error warning is deleted when the cause of error is eliminated.

#### **Diagnostic error (warning)**

If an error (warning) is signalled in the response byte, detailed fault information can be read out.

#### Table 3: I/O data and diagnostic data

Bit n°	Request byte	Response byte	Diagnostic error warning	Diagnostic error
Bit 0:	Magnet on, irrespective of power to lock or power to unlock principle	Safety output activated	Error output Y1	Error output Y1
Bit 1:		Actuator detected	Error output Y2	Error output Y2
Bit 2:		Actuator detected and locked	Cross-wire short	Cross-wire short
Bit 3:			Temperature too high	Temperature too high
Bit 4:		Input condition X1 and X2		Incorrect or defective actuator, bracket broken
Bit 5:		Coding recognised	Internal device error	Internal device error
Bit 6:		Error warning 1)	Communication error between the field bus Gateway and the safety switchgear	
Bit 7:	Error reset	Error (enabling path switched off)	Rotary handle not in authorised intermediate position	Rotary handle not in autho- rised intermediate position

(EN)

1) after 30 min -> fault

The described condition is reached, when Bit = 1

# 7. Set-up and maintenance

# 7.1 Functional testing

The safety function of the safety components must be tested. The following conditions must be previously checked and met:

- 1. Check max. axial misalignment of actuator and solenoid interlock.
- 2. Check max. angular misalignment (see "Mounting" part)
- 3. Fitting and integrity of the cable connections.
- 4. Check the switch enclosure for damage.
- 5. Remove particles of dust and soiling.
- 6. For variants with an emergency exit and emergency release, the following is to be considered:
  - For variants with emergency exits it should be possible to open the safety guard inside the hazardous area; it should not be possible to lock the safety guard from inside.
  - By operating the emergency release lever outside of the hazardous zone it must be possible to open the guard system.

# 7.2 Maintenance

In the case of correct installation and adequate use, the safety switchgear features maintenance-free functionality. A regular visual inspection and functional test, including the following steps, is recommended:

- Check for a secure installation of the actuator and the solenoid interlock
- Check max. axial misalignment of actuator and solenoid interlock.
- Check max. angular misalignment (see "Mounting" part)
- Fitting and integrity of the cable connections.
- Check the switch enclosure for damages
- Remove soiling

#### Damaged or defective components must be replaced.

#### 8. Disassembly and disposal

#### 8.1 Disassembly

The safety switchgear must be disassembled in a de-energised condition only.

#### 8.2 Disposal

The safety switchgear must be disposed of in an appropriate manner in accordance with the national prescriptions and legislations.

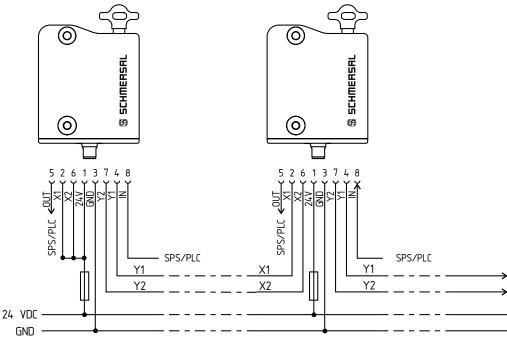

# 9. Appendix

## 9.1 Wiring examples

The application examples shown are suggestions. They however do not release the user from carefully checking whether the switchgear and its set-up are suitable for the individual application.

#### Wiring example 1: Series-wiring of the AZM300 with conventional diagnostic output

The voltage is supplied at both safety inputs of the terminal safety component of the chain (considered from the safety-monitoring module). The safety outputs of the first safety component are wired to the safety-monitoring module.

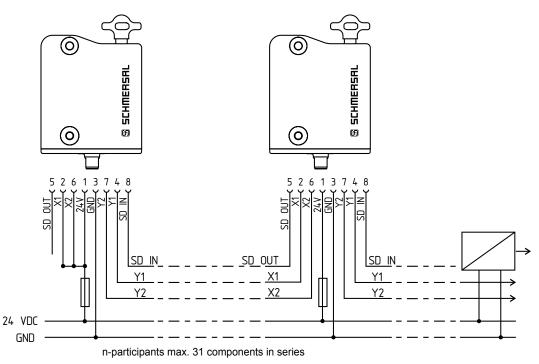

Y1 and Y2 = Safety outputs  $\rightarrow$  Safety monitoring module

EN

## Wiring example 2: Series-wiring of the AZM300 with serial diagnostic function

The safety outputs of the first safety component are wired to the safety-monitoring module. The serial Diagnostic Gateway is connected to the serial diagnostic input of the first safety component.

Y1 and Y2 = Safety outputs  $\rightarrow$  Safety monitoring module SD-IN  $\rightarrow$  Gateway  $\rightarrow$  Field bus
